No. 791 .--- Vol. XX.]

LONDON, SATURDAY, OCTOBER 19, 1850.

PRICE 6D.

POT HOUSE BRIDGE IRON-WORKS, NEAR BILSTON.—TO IRONMASTERS, ENGINEERS, AND OTHERS. MR. R. S. WALKER will SELL, BY AUCTION, on Monday

M. R. S. WALLER WILL STATE CONTROLLER STATE OF REAL STATES AND A R

TAW VALE RAILWAY .- IMPORTANT SALE.

TAW VALE RAILWAY.—IMPORIANT SALE.

MR. G. HEARSON respectfully announces, that he is instructed by Mr. Thorne, late contractor for the works on the above railway, to OFFER for SALE BY AUCTION, at the Railway Station, Barnstaple, on Wednesday, October 30th, and two following days, ALL THE MATERIALS that have been provided for the completion of the contract, and the PLANT now on the line, the whole of which must be said without reserve, the Taw Vale Railway board having directed the same to be removed forthwith.

pletion of the contract, and the PLANT now on the line, the whole of which mass to seem without reserve, the Taw Vale Railway board having directed the same to be removed forthwith.

The MATERIALS comprise about 6000 cubic feet of payanised memel timber, the greater part of which is in lengths of from 40 to 50 feet, carefully selected at Southampton and other ports for the permanent ginders of the river bridges; 3500 feet of 3-inch memel plant; 2000 feet of yellow pine timber; 1200 feet of plank, of various sizes; 1300 payanised railway sicepers, 9 feet long, 10 by 44; 1500 feet of oak, elm, and ash timber; 10 tons of new har iron, of various sizes; 7 tons of waggon and scrap iron; 12,000 bricks; 30, tons of larch poles; 2000 feet of sahlar stone; 600 yards of building atones, &c., &c.

The PLANT comprises a locomotive engine and tender, by Chapman, very little worn. Particulars as follows:—inside cylinder; 14-inch diameter, and 18-inch stroke; driving wheels, 6-feet diameter; lending and trailing wheels, 4-feet; strong copper fire-box, nearly new; and 111 tubes, 74 feet long; totaled diameter, 24 obsts of norse harnes; 2 timber waggons, with gins; 120 new picks, 80 shovels and grafting tools; and the bellows, and tools for four workshops; 5 pile engines, complete; a travelling crane, equal to 5 tons; several brass lifting pumps, with pipe; 3 lend pumps and pipe; 1 iron pump, and iron pipes of various sizes; a large quantity of gas fittings; 5 mortar mills; lifting jacks; boring tools; barrows; about 3000 temporary eleopers, and various other articles. The whole of the above will be particularized in catalogues, which may be had graftle. The whole of the above will be particularized in catalogues, which may be had graftles of the adoctonest, Litchdon-street, Barnataple, one week previous to the sale.

Approved bills will be taken at three months for all purchases above £30; and at six months for purchases above £40.

DEAN FOREST.—VALUABLE COAL AND IRON WORKS.

DEAN FOREST.—VALUABLE COAL AND IRON WORKS

DEAN FOREST.—VALUABLE COAL AND IRON WORKS.

Affording an opportunity seldom offered for asquiring a ligerative and first-rate concern.

MESSRS. ADAM MURRAY & SON are instructed to SELL.

BY AUCTION, at the King's Head. NEWPORT, MONMOUTHSHIRE, on Saturday, the 16th day of November mext, at Twelve o'clock, at noon (unless an acceptable offer be previously made), ALL THE IRON AND COAL WORKS, situate at BREAM, in the hundred of ST. BRIAYELS, GLOUCESTERSHIRE, now in the occupation of the BROMLEY HILL IRON AND COAL COMPANY.

The COAL-WORKS comprise two gales of the WHITTINGTON OR YARD DELF VEIN OF COAL, known as the Bromley Hill breel, and the Midsummer level, amounting to 200 acres, subject to a Royalty to the Crown of 14d, per ton, or a minimum rest of 44 a-year. Adjoining, is the BROMLEY HILL IRON MINE, of 400 acres, subject to a Royalty of 1d, per ton, and an annual rent to the Crown of \$i.0. A well built BLAST FURNACE and a STEAM-ENGINE of 45-herse power, with various buildings, are erected on the mines, and a never-failing stream of water runs through them. These mines are well situated both for railways and water carriage.

For further particulars, apply to Mr. Arthur Ryland, solicitor, Cherry-street, Birmingham, Mr. Reginald A. Parker, solicitor, Old Jewry Chambers, London; Mr. Fryer, solicitor, Coleford; or to Messus. A. Murray and Son, 35, Graven-street, Strand, London.

UPSET PRICE REDUCED.

UPSET PRICE REDUCED.

EAST OF SCOTLAND MALLEABLE IRON-WORKS. ASI OF SCOTLAND MALLELABLE IRON-WORKS.—
TO BE EXPOSED TO SALE, BY PUBLIC AUCTION, within the TOWN-HOUSE, DUNFERMLINE, on Wednesday, the 6th day of November next, at Twelve of clock noon, the EAST OF SCOTLAND MALLELABLE IRON-WORKS, at DUNFERMLINE, comprising—A STEAM-ENGINE, of 60-horse power, working the machinery, consisting of FORGE and 2 PUDDLE BAR TRAINS, of 16 in. diameter, HAMMER and PATENT SHINGLING MACHINE; also a 16-in. MERCHANT BAR or RAIL MILL, at 1910—LILL, for ordinary sized morehant bars, and an 8-in. GUIDE MILL, is PUDDLING FURNACES and 6 MILL FURNACES, the whole capable of producing 120 tons of bar-iron weekly.

DLING FURNACES and a MILL FURNACES, the work with blowing apparatus, complete, and two first erected.

A REFINERY STEAM-ENGINE, of 45-horse power, with blowing apparatus, complete, and two first erected.

A complete SET OF WORKSHOPS, containing a 20-horse power STEAM-ENGINE, driving a powerful ROLL TURNING LATHE.

A PUMPING and CLAY MILL STEAM-ENGINE, of 16-horse power, used for the manufacture of fire-brick and pumping water for supply of engines.

Also the ESTATE of TRANSY, consisting of about 107 imperial acres, with elegant MANSION-HOUSE and PLEASURE GROUNDS, situate about half a mile to the cast of the town of Dunfermiline.

MANSION-HOUSE and PLEASURE GROUNDS, situate about half a mile to the east of the town of Dunfermiline.

The above will be put up in one lot, at the reduced upset price of £16,000; if not sold in one lot, the iron-Works will be then exposed separately, at the very low upset price of £8500; and if the Works be disposed of, the Estate will then after be put up at the sum of £5500.

The purphaser of the works will have it in his option to take all the necessary tools, loose machinery, and stocks of different kinds, at a valuation.

There will also BE SOLD, a STEAM-ENGINE, of \$0 horse power, intended to drive the rolling-mills, apart from the forges, with strong cast-iron framing and relative machinery. For farther particulars, application may be made to Mr. James Inglis, the Chairman of the Board of Management; or to Johnstone, Russell, and Craig, writers, in Dunfermiline, in whose hands may be seen the title deeds of the lands and articles of roup.

Dunfermiline, October 3, 1850.

FOR SALE, BY PRIVATE CONTRACT.

THE LONDON VULCAN FOUNDRY AND ENGINEERING ESTABLISHMENT, PORT-DUNDAS, GLASGOW.
These WORKs have been erected within the last few years regardless of expense, having
all the recent improvements and facility for carrying on an extensive business, capable
of producing 40 tons castings dally, from five cupolas of the best construction.
The BUILDINGS and FLANT are most extensive, substantial, and well arranged,
having cranes to sweep the moulding floors, erecting shops, yard, and wharf, all being
most advantageously situated on the Forth and Cityde Canal, Port-Dundas, having free
access to and in the immediate vicinity of the principal Scotch mineral districts, and where,
vessels may be loaded for the London, Liverpool, and other markets.
These works are well worthy the attention of the trade, being at present in operation,
and intending purchasers may have them either with or without present contracts.

May be riewed on Tuesdays and Fridays, between the hours of ten and three o'clock,

May be viewed on Tuesdays and Fridays, between the hours of ten and three o'clock, a application to Mr. Alexander Balderston, 18, Renfield-street, Glasgow, who will fur-

TO BE SOLD, BY PRIVATE CONTRACT, EIGHTEEN SETS OF RAILWAY WHEELS AND AXLES, with wrought-fron spokes and troes, 2 feet 6 inches diameter, 51 inches on the face, and 1½ inch thick, narrow game TWO FOUNDRY CRAKES, to carry twenty tons each, with chain, blocks, and gear-

ing, complete.
FIFTEEN-HORSE CONDENSING STEAM-ENGINE, with direct action, having been

TWELVE-HORSE HIGH-PRESSURE STEAM-ENGINE, quite new. Apply to Thomas Dixon, iron merchant, Bradford, Yorkshire.

TO BE SOLD, BY AUCTION, THE FREEHOLD FARM, called "THE HOLE," containing 103 acres (or thereabouts) of anciently-enclosed LANDS, and 222 acres (or thereabouts) of more recently enclosed PASTURE, and an undivided moiety of an outer adjoining FASTURE, containing 838 acres (or thereabouts) situate in PRIORSDALE, in the parish of ALSTOR, in the count of CUMBELLAND. The MINERALS under the anciently enclosed lands belong to the proprietor of the soil, and those under the two pastures belong to him jointly with the Commissioners of the Greenwich Hospital.

The ESTATE is intersected by NUMBEROUS VEINS of LEAD ORE, mostly unexplored, but in strata favourable to the production of lead ores, being the same as in the adjoining manor of ALSTON MOOR, where extensive lead mines are worked.

The time and place of sale will be announced in a future advertisement. Reference to

The time and place of sale will be announced in a future advertisement. Reference to Messrs. J. and R. Gibson, solicitors, Hexham, Northumberland.

WALUABLE MINERAL PROPERTY TO BE IN PART OR WHOLLY DISPOSED OF.—This most destrable METALLIFEROUS SETT, consisting of nearly 2000 acres, is situated in one of the renowned mining districts of central WALES. One discovery of SILVER-LEAD ORE, made upon it some few months ago, was considered of so singular and promising a nature, that a brief account of it was then published, and subsequently copied into most of the leading papers of the kingdom. Since that period a shallow sink has been made on the lode, which is 6 test wide, traversing a beautiful soft whitish killss. The analysis of the ore, of which there is about 20 tons on the bank, gives 75 per cent. of lead and 80 ounces of silver to the ton; indeed, the last assay of the ore, found at about 7 fathoms from the surface, gave the extraordinary quantity of 200 ounces of silver to the ton. There is a fine mixture of lead are at the bottom of the present shallow shaft. The mine is but 9 miles (of good turaplic-read) from the shipping port, and a fine stream of water runs) close past it, offering every facility for the development of its favaluable mineral resources.

For further particulars apply (post-paid) to "X. Y. Z.," at the office of the Mining r further particulars apply (post-paid) to "X. Y. Z.," at the office of the Mining

MR. JAMES CROFTS, in renewing his offers of services to Capitalists in favour of INVESTMENTS in BRITISH MINES, is encouraged to refer, in terms more marked than he has hitherto done, to the classes of Mines either paying dividends or progressing rapidly towards that satisfactory position. Such remarkable success has attended the workings of numerons Cornish Mines during the last few months (instance the Alfred Consols, Wellington, West Seton, &c.), as to demonstrate that it is only necessary to make a judicious selection of the adventure to insure profits quite as certain as any mercantile speculation whatever; and Mr. Crofts will be happy to indicate such undertakings as present the greatest chances of permanent dividends, or ultimate success in the workings, whether on a large or a small scale.

Mr. CROFTS has FOR SALE West Wheal Jewei (10 shares). Wheal Crebot (10 shares).

Mr. CROFTS has FOR SALE West Wheal Jewel (10 shares), Wheal Crebor (10 shares), Bedford United (10 shares), South Tamar (20 shares), Beale Trescoil (20 shares), North Stepherds (5 shares), Lanherose (10 shares), Wheal Benny, Comblewn, Wheal Vincent, and Wheal Sarah. The two latter mines (the lodes having been reached, and ore raised sufficient to show that the opinions of their capability to become asis investments are well based) are particularly worth attention; and Mr. Crofts is ready to open a treaty with any capitalist for an interest in each, on highly favourable terms.

Mr. Charra will mentality strend to communications from the country, whether for

Mr. Caorrs will punctually attend to communications from the country, whether for lessle or purchase of shares, and transacts business only for principals.

"a" Wanted to purchase—2 shares, Devon Great Consols.

No. 4, King-street, Cheapside, October 18, 1800.;

CRAIG-Y-MWYN LEAD MINING COMPANY, LLANRHIADR, MONTGOMERYSHIRE.

—Deposit £8 per share—payment, £4 on receipt of scrip, and the reamouthly instalments of £1 each, the whole to be paid in four months. maining £4 in monthly instalments of £1 each, the whole to be paid in four months.

The FORMATION of this COMPANY being now COMPLETED, and the annexed Rules and Regulations adopted for the government of the Company, the following gentlemen were appointed a Committee of Manacement:

RICHARD N. BROUGHTON, Esq. (Chairman).

THOMAS HIBBY, Esq., ROBERT BROUGHTON, Esq. (Chairman).

THOMAS HIBBY, Esq., (Secretary).

WILLIAM LLOYD ASTERLEY, Esq.

PUBSER—Thomas Bibby.

LOCAL MARAGER—Edward Hampson.

Applications for the remaining shares to be made to the Secretary, at his office, No. 16, Castle-street, Liverpool, where reports, together with plans and sections of the works, may be seen.

SUMMARY OF THE RULES ADOPTED FOR THE GOVERNMENT OF THE COMPANY.

That the adventure be divided into 1600 shares, of £8 each.

That the affairs of the company be managed by a committee of five, three of who hall form a quorum.

That the affairs of the company be managed by a committee of five, three of whom shall form a quorum.

Members of committee to possess 50 shares.

General meetings to be held every three months.

That the mine be worked under the Cost-book System.

Accounts to be made up monthly, and paid by the purser, and to be submitted to the general meetings, at which calls, not exceeding the estimate for the succeeding three months shall be mades, if required.

Dividends to be declared at general meetings, and committee elected for six months. Each share to represent one vote—proxies to be held by shareholders only. Officers of the company to be applied to, or removed, at the general meetings, such meetings to be called by circular, giving seven day's notice, with a statement of business to be transacted.

Lists of shareholders to be presented at each general meeting, and be signed by the chairman.

bairman.

All transfer of shares to be passed through the books of the company.

That all monies be paid to the purser, who shall pay the same to the company's bankers,
be drawn out by choques, signed by three members of the committee and the secretary.

Copies of resolutions, and abstract of accounts, to be sent to every shareholder, within

even days after general meetings.

Any shareholder to be at liberty, withdraw from the undertaking, by giving three

nonths' notice in writing, and syling liabilities up to the expiration of such notice.

Any shareholder to be at linerty.

Any shareholder to be at linerty shareholder to be at linerty shareholder to be at linerty shareholder.

WEST PHENIX MINE, in the parishes of LINKING-HORRE AND ST. CLEER, NEAR LISKEARD, CORNWALL.
Divided into 1024 shares.—Deposit £2 per share.

At a Meeting of Shareholders, held at the offices of the Company, No. 14, High-street-Exeter, on Monday, the 14th day of October, 1850.

JEFFERY LANG, Esq., M.D., Chairman,

Several reports and other documents having been read, whereby the evidence is conclusive and undentable, as regards the West Phonix lode being the same as the Phonix, on which an immense quantity of rich ore is now raising; and as it is fully demonstrated to this meeting that similar large deposits positively exist in the West Phonix sett, and at a very shallow depth.—

Resolved,—That the mine be proceeded with immediately, and that the utmost economy be observed in carrying on the works.

Resolved,—That are committee be appointed to carry such object into effect, consisting of Jeffery Lang, Esq., M.D., John Porter, Esq., Edward Suter, Esq., Mr. W. Milton, W. Whitchurch, Esq., Mr. Henry Vatcher, John Symons Higgs, Esq., Charles Richards, Esq., Mr. W. Hilliam Channing, Mr. W. Luxmore Jones, Robert Serjeant, Esq., Mr. Wm. Balle—the committee having offered their services gratuitously.

Resolved,—That the best thanks of the meeting be given to the chairman for his able conduct in the chair.

(Signed) JEFFERY LANG, M.D.

This invaluable mine adjoins the Phoenix, whose riches as a copper and tin mine now

This invaluable mine adjoins the Phemix, whose riches as a copper and tin mine now prove enormous. The lodes in the West Phienix sett are parallel, and not far from the south and West Caradon Mines- the shares of the former originally cost £5, and now selling at £990; the latter £30, and now selling at £95. The two great cross-courses of South and West Caradon pass through this sett. The lode in West Phemis set is large, varies from 10 to 20 feet wide, strong and well defined, is the same lode as the Phemix, and carries precisely the same indications. It is also secretained that a rich course of one now exists in the 13 fathom level, 14 inches wide, and worth from £90 to £100 per fathom. The small sum of £1150 has been paid for the sett, which will be reimbursed.

Report of Evan Hopkins, Esq.

This sett is situate at the south-west foot of the Cheesewring, in the Caradon mining district. The lodes passing through this property are the continuation of the Phenic Modes westward; but as they leave the pale brown slate of the latter mine, and enter into the schorisceous granite of the Withybrook, they become more productive of tin than copper. The granite 2 here traversed by many soft channels of ground, and also by large veins of schorl rock, which are more or less impregnated with tin. The lodes in large veins of school rock, which are more or less impregnated with int. The lodes this set are intersected by the West Caradon cross-courses, and are of considerable mag nitude, judging from the ancient superficial workings. Large quantities of rock, containing tin, may be extracted from this set at a moderate depth, and probably a large amount of the black and grey copper ore also on the east side of the main cross-course This mine should be worked in very wide excavations, as I think the lode will be found in numerous branches; and a more economical mode of the dressing should be introduced, than the ordinary method employed in the county of Cernwall—by these means it may be rendered a very valuable property.

13, Austinfriars, London, June 28, 1850.

13, Austinfriars, London, June 26, 1850.

Report of Capt. Samuel Seccessis, of the Phomix Mine.

In compliance with your request, it beg to furnsh you with the following report of the West Phoenix, or Withybrook, Mine, which is stuate to the west of, and adjoins the Phoenix Mine—the stratage both mines is grantic. The West Phoenix, or Withybrook, Mine sett, contains several known lodes; the greiter part of them has been worked on more or less, for tin, by the ancients; one in partitular has been more extensively worked on than the others, and which is a continuation of the principal lode in the Phoenix sett, and is preclay the same lode as the one proving or fich and productive for copper ore in that mine. It is a large strong lode, varying in see from 10 to upwards of 20 feet wide, and very extensively worked ener your eastern boundary, to the depth of 40 fathoms, and in these workings yielded large returns of it, which was found chiefly in the captes of the lode. The gossan part of the lode in these workings is large, and contains small portions of copper ore, and presenting good indications that the lode will, when laid open to a reasonable depth, be found to contain large deposits of copper ores of rich quality. I have been informed that the deepest workings as this lode in your set are only 14 fins. below the surface, and at that shallow depth the lode was found to contain large quantities of rich tin, but could not be followed, having no machinery to keep the workings drained. These old workings are now full of water and stuff, and cannot be examined until cleared up; but, indefine found what can in seen of this lode in the Phoenix setf, and their contiguity to each other, I am fully persuaded that if the West Phonux, or Withybrook, Mine be effectually laid open, it will prove to be a lasting and profitable mine, and one that will not require a very large emount of capital, if judiciously laid out. Listeard, August 31, 1850.

WANTED.—A MANAGING AGENT for a LEAD and COPPER MINE, of some magnitude, in CORNWALL: he must be intelligent and respectable, possess good practical mining knowledge, and an active disposition.—Applications, with testimonials, to be addressed to E. H. Pike, Esq., Camborne.

WANTED AN ENGINEER,—A steady Man, of temperate habits and good moral character, from thirty to forty years of age. He will be required to proceed to Spain almost immediately, and must be competent to WORK and KEEP IN REPAIR the ENGINE and MACHINERY at the LINARES MINES. Wages, 47 per month, on an agreement for the term of three years. Applications to be addressed to Mr. Eaton, No. 2, New Broad-street, London, to be accompanied by a reference for character and ability.

WANTED, BY THE MINING COMPANY OF THE CENTRAL PYRENEES, a RESPECTABLE PARTY. either to take the MANAGEMENT on behalf of the company, or to RENT their MANGANESE, and silver-containing LEAD ORE MINES.

For particulars, apply to Graetzer and Hermann, 3, Huggin-lane, Wood-street.

WANTED,—A Young Man, having a SMALL CAPITAL, portunity of EMPLOYING his MONEY and TIME in any SUITABLE UNDERTAKING. He is a good accountant and correspondent, and well acquainted with the German Language.—Address, "M. R. N.," Post-office, Birmingham, or application may be made at the office of the Mining Journal.

RAUGHTSMAN.-WANTED, in an IRON-SHIPBUILD-ING ESTABLISHMENT, one who has been accustomed to MARINE ARCHITECTURAL DRAWINGS, and is conversant with MATHEMATICS, will be preferred. Application to state qualifications, testimonials, and salary expected. Also, an ABTICLED PUFIL, who will have every opportunity of acquiring a theoretical and practical knowledge of the business.—Apply to James Panton, 60, Graceclurel-street, London.

TO MINE AGENTS.—WANTED, for COOK'S KITCHEN
MINE, near CAMBORNE, CORNWALL, a MANAGING AGENT, who possesses
a thorough practical knowledge of Mining, and who perfectly understands the Dressing
of Tin. Salary Twelve Guiness a month.—Applications, with testimonials, to be addressed
to Mr. Pike, Camborne, prior to the 29th inst.

SHARES IN A COPPER MINE are OFFERED to CAPI-TALISTS on ADVANTAGEOUS TERMS.—The Mine is situated in one of the most favourable districts in the West of England; is complete in all needful machinery, and will soon yield an ample return for the capital invested. Reference will; be given to a mining engineer of the first eminence.—Apply to Messrs. Cornthwaite and Wilson, solicitors, 14, Old Jewry Chambers, London.

LAST EDMONDSLEY COLLIERY.—'TO BE SOLD,
OR LET, the CURRENT-GOING COLLIERY of EAST EDMONDSLEY, in the
county of DURHAM, containing 174 acres, or thereabouts, held under leases, of which
shout 39 years are unexpired. The coal has been sold in the markets as "Gloon's WalfsEnd" and "North Durham Walfs-End." The purchaser or lesses will be required to
take the engines, &c., at a valuation, which will be of small amount.

For further particulars apply to Mr. William Barkus, viewer, Lowfell, Gateshead.

For further particulars apply to Mr. William Barkus, viower, Lowfell, Gateshead.

EA SALE COLLIERY.—TO BE LET, and entered upon at Lady-day, 1851, all that CUBRENT-GOING COLLIERY, called PERCY MAIN COLLIERY, in the manar of TYNEMOUTH, and county of NORTHUMBERLAND, stuated within two miles of the mouth of the River Tyne, and only half a mile distant from the shipping place.

This Colliery has Three Coal Pits, and an Engine Pit, with Engines, a Railway, Two Shipping Places, very convenient Workmen's Houses, and other Portions of a Colliery Establishment complete.

The royalty comprises an extent of nearly 1000 acres, and is being worked in the High Main and Bensham Seam has been very partially worked; is 5 for high, and is considered equal in section, produce, and quality, to any of the same seam in the neighbourhood.

The land held by the present lessees will either be let along with the colliery, or severed therefrom, as may be agreed upon.

For further particulars apply to Mr. Thomas John Taylor, Earsdon, near Newcastle-upon-Tyne; information may also be procured from the lessees viewer, Mr. Thomas E. Forster, 7, Ellison-place, Newcastle, and from the agents resident upon the colliery. Almylic Castle, October 11, 1850.

MR. J. C. NESBIT, F.G.S., F.C.S., CONSULTING AND ANALYTICAL CHEMIST.

LABORATORIES—38, KENNINGTON-LANE, LONDON.

Mr. NESBIT gives PRIVATE INSTRUCTIONS in CHEMICAL ANALYSIS, and may be consulted on subjects connected with the Composition, Working, or Assaying of Minerals.—Analyses of Minerals, Siags, Solls, Manures, &c. &c., performed as usual, on moderate terms.

MINING—COMPANIES of respectability requiring OFFICES for CARRYING on their AFFAIRS in LONDON, including MANAGEMENT, may be ACCOMMODATED on application to Mr. FENTON, No. 5, WHITE HART-COURT, LOMBARD-STREET.—SHARES ON SALE in those well-known dividend-paying Mines, South Caradon, Providence, Spearne Consols, Carn Brea, Wheal Rose, &c., and a FEW for DISPOSAL in those promising adventures Wheal Arthur, Wheal Oak, Warleggan Consols, South Relistian, &c.

MINING OFFICES, No. 9, ST. MICHAEL'S-ALLEY, CORNHILL, CITY (established 20 years).—WM. TRENERY bega respectfully CORNHILL, CITY (established 20 years).—WM. TRENERY begs respectfully to inform the Public that he is all times in a position to BUY or SELL SHARES in most of the DIVIDEND-PAYING MINES; and being a native of Cornwail, he is always ready to give the best information respecting mining property in general.

MINING PROPERTY.—Messrs. BROWN, FULLER, & CO., 48, THREADNEEDLE-STREET, LONDON, beg respectfully to inform the public, that they are at all times in a position to BUY or SELL SHARES in all the DI-VIDEND-PAYING MINES, and have on hand South Carn Brea, Wheal Spry, Wheal Russell, &c.—Oct. 18, 1850.

MINING PROPERTY.—BUSINESS transacted in every description of MINING PROPERTY, SHARES BOUGHT and SOLD, ADVICE GIVEN to PARTIES as to INVESTMENT, ADVANCES of MONEY MADE on this DESCRIPTION of PROPERTY, Statistics given on Mines, and the earliest information obtained from the mineral districts.—Apply to DURRANT & CO., Mining Sharebrokers, 88. Lombard-street.

MINES.—MOLYNEUX & CO., 6, FINSBURY-PLACE SOUTH, and 6, WEST-STREET, FINSBURY-CIRCUS, have SHARES FOR SALE in DIVIDEND-PAYING and OTHER MINES, which will ensure to capitalists the safest and most unexceptionable investment.—Office hours from Ten to Five o'clock.

MR. R. SYMONS, LAND and MINERAL SURVEYOR, OFFERS his SERVICES to SURVEY and PREPARE accurate PLANS and SECTIONS, and SURFACE MAPS, of MINES; also to INSPECT and REPORT on MINES in DEVON and CORNWALL.—Resident in the midst of the best mining locality at present known in the world, Mr. Symons is in possession of the most recent and correct information as to the state and prospects of the Cornlah Mines in particular, and is ready to communicate such information as is requisite to give a right direction to the spirit of enterprise in this most important branch of industry.

Address, either Truro or Camborne, Cornwall.—Camborne, October 14, 1850.

MANUEL AND CO., MINING AGENTS, are instructed to SELL in the following DIVIDEND-PAYING MINES:—South Frances, Wheal Seton, Treviskey, South Basset, &c., also in other mines, including—Russells, Runnaford Coombe, Exmoors, &c.—Office, 42, Fish-street-hill, London.

MR. R. TRIPP, MINING AGENT, has for SALE SHARES in most of the best DIVIDEND-PAYING MINES, and others, including—Devon Great Consols, West Caradon, South Caradon, Botallack, Wheal Margaret, Alfred Consols, Wheal Tremsyne, Treviskey and Barrier, North Pool, Condurrow, Tincroft, Tamar Consols, Wheal Trescoll, Hennock, Treville, Wheal Fenhale, Carthew Consols, Spearne Consols, West Wheal Treasury, &c.—Forking: Burns Burns, Linares, Santiago, United Mexican, Cobre, &c. MINING AND SHARE OFFICES, ST. MICHAEUS CHAMBERS, ST. MICHAEUS ALLEY, CORNHILL, LONDON.

MESSRS. BOXALL & CO., MINING SHARE DEALERS, 5, CROSBY HALL CHAMBERS, BISHOPSGATE-STREET.

CREFT AND CO., 1, ROYAL EXCHANGE BUILDINGS,
LONDON, can always BUY or SELL every description of MINING SHARES,
WANTED, Poter Tavy and Mary Tavy shares, for which a large premium will be given

JAMES LANE, MINING SHARE DEALER, 80, OLD BROAD-STREET, LONDON.

MINING COMPANY OF WALES.—PROSPECTUSES, containing REPORTS on the MINES and QUARRIES of the COMPANY, Terms and Conditions for its Government, &c., may be had of ST. PIERRE FOLEY, Secretary, to whom letters on the allohement of shares, and on the general business of the Company, are to be addressed.—Offices, 24, Lincoln's Inn-fields, London.

CRYSTALLOGRAPHY—PROFESSOR TENNANT'S LECTURES.

Prof. TENNANT delivered the second of his course of lectures this season to the students of King's College, on Wednesday. He commerced, by remarking that of the physical properties of minerals no one was estimpertant in itself as that by which crystals or regular solids were produced. To investigate and describe these solids was the object of crystallography, and constituted, without doubt, the most interesting branch of mineralogical research. Crystallisation, in the most hmited meaning of the term, was that process by which the particles of bodies united in such a manner as to produce determinate and regular solids. It was equally true, that those minerals which possessed a foliated or tructure were the products of crystallisation, under circuit

doobt, the most insertening of the term; was that process by which the particles of bodies united in sich a manner as to ground eleterminate and regular solids. It was equally true, that those minerals which possessed a foliated or fibrous structure were the products of crystallisation, under circumstances which had rendered the process more we has imperfect, and prevented the appearance of distinct and regular forms. For instance, if a quantity of moristo of evaporate slowly by a moderets heat, or, indeed, without the application of artificial bast, the particles of all would separate from the water, unite, and form -very small cubes, which would float on the surface unit their agregated weight, them, and then the control of the c

It was obvious, then, that a mineral was an assemblage of particles, and that it increased in size merely by the juxta-position of similar integrant particles. It depended upon no interior mechanism, like organic bodies, for its growth; but it was enlarged in its dimensions by the application of successive layers of particles. The integrant particles were believed in the same substance to possess the same form and dimensions; but they did not, as might have been expected, always combine in the same manner. It was true there were many bodies which had a determinate form, under which each of them most frequently appeared. Thus, muriate of soda presented a cube, and rock crystal a six-sided prism. Sulphate of lead formed a cube and an octohedron just as often; while more frequently than either it was found in some form between the two, in which the faces of the two forms might be found in the same figures. If crystals of sulphuret of lead, however, were broken, they would always resolve themselves into cubic particles. After dwelling at considerable length upon the results of difference of arrangement in the integral particles, in the course of which he familiarly illustrated some of his remarks by an exhibition of the crystals of barley-sugar, and mentioned the recent improvements in the manufacture of lump and crystallised sugars, by which it was now crystallised in a vacuum, instead of being burnt—a diminution of the pressure of the atmosphere being found highly favourable to crystallisation, a fact which accounted, perhaps, for the greater perfection and size of crystallise formed in deep veins in the earth's crist—the lecturer directed the attention of the students to a tabular exhibition, compfled from different sources, of the results of the different systems of crystallographers, adopted by Rose, Brewster, Herschell, Brook, Miller, and others; and illustrated them with numerous ingenious models constructed of pasteboard, glass, and wire.

The lecturer concluded by briefly explaining the mode in which the s

inders, of exactly the same circumference, arranged by Prof. Faraday, which shibited, at a glance, the different specific gravities of different notals by heir length. Platinum had the greatest specific gravity, and was, consequently, the least gold next; then, in a nearly regular gradation, lead, merary, silver, bismuth, copper, iron, tin, and antimony; and then sellum and otassium, the two last being, at least, 20 times the bulk of platinum.

[The next lecture will relate to quartz and siliceous minerals.]

[The next lecture will relate to quartz and silicous minerals.]

\*\*LIFE ASSURANCE FOR THE MILLION.\*\*

We have had to notice literary "food for the million," and public banefits in other forms, made accessible to the many. All such attempts are laudable. We have now to commend a bold and novel attempt to afford the advantages of Life Assurance to the million—that is to say, to the million of raidings for sellers. For a man to be informed that, by paying threepeace in the first-class he could insure to his family 1000/.—for taopence, in the second-class, 500/.—and for one penns, in the third-class, 200/., in the event of his death by railway accident, or a commensurate award for personal injury, would be almost playing upon his credulity. At the first blush of the proposal, it must, no doubt, appear to many an argumentum and absurdings. On the contrary, it is a positive fact that such assurances are to be obtained through the medium of the Railway Passuagers' Assurance Company; and many are the witnesses to the traith of the seasonableness of the donations granted by this company in cases of railway accidents. The company has been in existence only a twelvemonth, and yet from their premisuss they exhibit, in their annual report, an income of nearly 4000l. for that period. What has the company done in return? Why, the report states that 37 cases have applied for compensation. One of them was awarded 210 (this eyes being permanently injured); a second 42 (much sealded and hart); another 36 (man and wife, seriously hurt); a fourth 30 (an engineer, proceeding to Canada); and several minor sums, even for loss of time through those accidents. Thus, the company has been tested, and the integrity of its promoters has been promigated. Looking at the immense number of travellers amongst the middling and working classes of the country, it is to be hoped that the taking out of an assurance toket will become a regular habit with all, to provide against the serious properties the insense of death or accident; for at present no

SPECIFICATIONS ENROLLED DURDS; THE PAST WEEK.

SPECIFICATIONS ENROLLED DURING THE PAST WEEK.

G. H. Phipps, Park-road, Stockwell, singineer: For improvements in propelling vessels to be propelled by a screw or screws, so that the apper portion of the stern to vessels to be propelled by a screw or screws, so that the apper portion of the stern is made to overhang or project over the lower partion, whereby all horizontal lines from the boutom of the vessel to the level of the top of propeller will converge to a vertical line in advance thereof, and all horizontal lines above the level of the top of the propeller will converge to a vertical line further at than the extremity of the same. The advantages assumed to be derived from this construction (which may be familiarly illustrated by supposing a vessel to be cut in two longitudinally and horizontally, and the upper portion slid along so as to project beyond the lower half) are:—1. To obtain the smallest amount of resistance from minus pressure at the atern, hence securing more solid water for the screw or screws to act in, as regards all the water on a level therewith.—2. To obtain a clear run of all the water above the level of the propeller to the rudder.—3. To obtain as small an abstraction as possible from the buoyancy of the vessel, in consequence of diminished displacement.—4. The power of dievating or depressing acrew propellers by any means what sever, so as to work the acrew at any required alltinde. The machinary employed for working the propeller is in this, as in the former instance, that of ordinary construction; but to allow of the shaft being elevated, it is united to the driving power by a universal joint, and the elevation is effected by means of a screw turned from the deck of the vessel, and attached by slings to a coliar on the propeller shaft.

E. A. CRAMEROY, Paris: For improvements in the manufacture of boilers, and of pipes

and stached by slings to a collar on the propener shart.

E. A. CHAMEROY, Paris: For improvements in the manufacture of bollers, and of pipes of malleable substances as well as of elastic matter. Mr. Chameroy claims—1. A machine for rolling metal tabes, by which they may be formed of any bore and thinness of metal. This machine consists of two rollers, one of which has at each end a raff or collar, and at the other a corresponding part cut away. A hollow cylinder of metal is introduced between these rollers, and after being sufficiently reduced by successive rollings, by which it acquires the form of a double place connected at the edges, a tapering mandril is in-serted between the surfaces, whereby the metal is opened out and forms a tube with a longitudinal rib on each side. In this siste the tube can be applied to various useful purposes, such as supplying gas or water.—2. A machine for rolling tubes or other forms, which is described to consist mainly of a series of conical rollers, having one part of their circumference with a cam surface arranged round a mandril, over which is placed the metal to be operated on. Rotary motion is communicated to these rollers, and the all did frame supporting the mandril pushed forward till the metal assumes the required length and thickness. To remove the tube easily from the mandril, it is passed between concave rollers, and thereby lossened.—3. The formation of tubes and other forms by rolling the material under operation between metal bars, which have a traversing motion, to and free, imparted to them by suitable cranked gearing.

J. TURNER, Birmingham, engineer, and J. Hardwick, of the same place: For a certain improvement or certain improvements in the construction and setting of steam-boilers. Casims.—1. The causing a current of heated sir to pass across the interior portion of a steam-boiler through one or more fises; also the contraction of the fire-place immediately below the man-hole, so as to give greater room for the entrance of a man for the purpose of cleaning out the bottler.—2. A particular method of setting steam-boilers, as to have fises passing under and around the boiler, which fitus are so arranged as to divide the current of fiams and heated sir, whereby a more equable distribution thereof over the surface exposed to instit is obtained. fame and heated air, whereby ed to heat is obtained.

C. De Bracure, Arthur-street, London, engineer: For certain improvements in locomotive and other steam-engines, also is buffers for railway purposes. Claims.—1. The application of a small piston or pistons for communicating an expanding motion to the rings of motallic pistons, whereby a certain amount of pressure on the expanding ring may be ensured and regulated by the size of the small pistons.—2. An arrangement for relieving the cylinder from a pertion of the piston, to yetting away a portion of the junk ring, and allowing the piston to rest principally on the metallic packing.

—3. A peculiar arrangement and combination of the parts of buffers. This improvement refers mainly to an improvement pro a station buffer formerly patented by Mr. De Bergue.

LIST OF PATENTS GRANTED DURING THE PAST WEEK. els, of London, gent man, for improvements in treating and preparing pota-

G. Michiels, of London, gentieman, are improvements in steam-engines in J. Fowler, jun., of Melkaham, Wilts, engineer, for improvements in steam-engines in raising and foreing fluids in irrigating and draining land, and in machinery for cutting wood for drain pipes and other uses.

D. T. Shears, of Bankside, Surrey, capper merchant, for improvements in the manufacture and refining of sugar.

wood nor drain pipes and other uses.

D. T. Sheara, of Bankside, Sarrey, cipper merchant, for improvements in the manufacture and refining of sugar.

J. E. Johnson, of Crawford-street, chemist, for improvements in fixing colours on fabrics made of cotton and other fibre.

J. H. Baddeley, of Shelton, Stafford, ingineer and designer, for improvements in the manufacture of ornamental articles of exthenware.

T. E. Harding, of Lille, France, manufacturer, for improvements in machinery for backling and carding flax in machinery for combing and drawing wood and other fibrous materials, and in machinery for making parts of such machines, and for a new arrangement of the steam-engine for driving flax and woollen mills, which arrangement is also applicable to other purposes where moves power is required.

H. B. Barlow, of Manchester, consilting engineer, for improvements in spirming cotton and other fibrous materials.

J. Young, of Manchester, manufacturing chemist, for improvements in the treatment of certain bituminous mineral substances, and in obtaining products therefrom.

J. H. Williams, of Birmingham, manufacturer, for certain improvements in the manufactures of buttons.

DESIGNS FOR ARTICLES OF UTILITY REGISTERED.

L. Dutreth, Wellington-street, Strand, plantoform, or instrument for meas lect of horses for facilitating shoeing.

M. Gardiner, Ashill, near Watton, lever spring-drop.

J. Gray, and R. J. Reen, Liverpool, ashi-vibration elastic compass disc.

J. Smith, Uxbridge, revolving sinter.

T. S. Freeman, Farchtruch-street, safety pocket for waistcosts.

O. Beinhauer, Hamburg, economical registered store.—Mechanica Mayarine.

FOREIGN INTELLIGENCE.

MERICAN LEAD TRADE.—New York advices supply a statement of the ments of lead from the Upper Mississippi mines during the last four years, mencing with September and ending with August in each year. It may soficed, that no shipments are ever made in January, and but rarely in ember and February, the navigation generally closing in the latter part of ember, and opening early in March. The statement is as follows:—

	1846-7.		1847-8.		1848-9		1849-50.
September	58,869			*****			46,798
October	71,502		56,335		69,170		74,207
November	58,436	*****	67,514	****	40,089		65,149
December	-	*****	-		- manual		3,471
March	24,686	*****	47,216		38,625	** ***	52,311
April	73,150	*****	94,467		71,184		81,579

July	107,918		88,556		77,604	*****	.52,756
August	65,080		70,538		66,345	** ** **	40,000
STATISTICS IN CO.	-	A Chigan	-				-
Total pigs	764,077	1	706,849	1 2	611,817	6 6 0	502,120

It will be seen that the production of lead from this quarter has undergone a progressive and considerable decline during the last four years. The shipments up to the 7th September this year are 80,020 pigs, against 51,552 during the same period of 1849.

up to the 7th September this year are 30,020 pigs, against 51,552 during the same period of 1849.

The mines near Little Rock, Arkansas, continue to prove extremely rich in the argentiferous lead ore. Since May upwards of 150,000 lbs. of mineral have been raised, most of which has been prepared and sent forward to market. The mining operations will, for the present, be confined more immediately to sinking the main shaft at the diggings (which is now 90 feet) through the black state which is found at this depth. It is the determination of the company to increase their force, and vigorously prosecute the work. During the previous week another extensive vein of mineral had been discovered, which promises to remunerate the proprietors liberally for all outlays.

THE "BLACK-LEAD" IN NEW BRUNSWICK.—The St. John's Mining Company are now successfully working their recently discovered mine, and their prospects are said to be extremely encouraging. Seven persons are now employed in extracting the lead from the vein, which is simply done with a pick and hammer; they get out about 40 barrels per day, and since the company have been in operation (about four weeks), they have taken 900 barrels, 400 of the first quality, and 500 of the second. It is thought this lead will realise the company about 22, per barrel; and should this expectation be met, the six individuals composing the association will probably make handsome fortunes. The Courier states its belief that "the only thing which can prevent it turning out a very lucrative speculation will be the want of a sufficient market for such large quantities as can be taken from the veins, as the celebrated Borrowdale Mines in England are only opened at limited and stated periods on this account, to preven the markets from being overstocked." The company have secured the right to carry on their operation for 25 years, to the extent of three square miles in that locality by paying to the Government the assal preference price of 55 per mile, and 4 per cent. on their produce.

CAL

CALIFORNIA.—News from San Francisco to the lat Sept. has been received, and which is more favourable than any which has previously come to hand. The accounts from the gold regions are most encouraging, and peace had been quite restored at Sacramento City.

Accounts from Washington, announce that Col. Fremont's measure to regulate the gold mines of California (an abstract of which appeared in last week's Journal) had passed the Senate.

Accounts from Washington, announce that Col. Fremont's measure to regulate the gold mines of California (an abstract of which appeared in last week's Journal) had passed the Senate.

OPERATIONS AT THE MARAPOSA GOLD MINES, CALIFORNIA.—We have just had an interview with W. A. Jackson, Esq., who this morning arrived from the Maraposa mining establishment, where operations have been very successfully commenced in the quarts formations. The vein has been opened and explored by this company for the distance of 200 or 300 feet.; it is from 6 to 8 feet wide. Explorations have been made near the centre to the depth of 30 feet, and the or has imcreased in richness to that depth, showing more of the decomposed description, and the shale formation. The course of the vein has been laid open parance of a regular ledge. The company have projected a tunnel from the surface, which will give the company the whole lode of ore through all seasons of the year. The property has been acquired in such a manner as to preclude the possibility of the assertion of any adverse claim, and must be regarded as one of the greatest properties, except the quicksilver mines of New Almaden, yet acquired in this country. They pay Fremont 4 per cent. The specimens brought down by Mr. Jackson, and lodged with Messrs. Palmer, Cook, and Co., are the richest we have ever seen.—San Francisco News, Aug. 15.

ESTIMATE OF THE PROBABLE YIELD OF THE MINES OF CALIFORNIA.—It is estimated that up to this time full \$150,000,000 in gold dust have been exported from California, or which nearly 28,000,000 have been received at the United States Mint, and probably \$2,000,000 worth of gold dust from the hands of individuals, or has been used for the manufacture of jewellery and other trinkets; making an aggregate of \$30,000,000 worth of gold dust received in this country. A large amount of gold has been taken to Oregon and Mexico, direct from the mines, without passing through \$30,000,000 more partition, and the effect of such a stupendous accession to the gold curren

for conducting trade will be equal to any legitimate demand, and there is consequently no restriction of credit, no fear of an immediate revulsion.

The Worthing Copper Mine.—In the course of a trip to the south last week, we paid a visit to this mine, and were kindly shown over it by Hr. Hallett, the resident-manager, and Capt. Richards. The Worthing estate consists of about 900 acres, on the sea coast, about 12 miles from town. It is intersected by a stream of excellent water which runs the whole year. At the mouth of this stream is a small bar harbour, sheltered from the prevailing winds, which could, at little expense, be made to accommodate a considerable coasting trade. The lodes cross the country in a direction from north-east to south-west. We traced one of them for two miles, along the greater portion of which the ore, principally carbonates and pyrites, with a mixture of grey ore, cropped out on the surface. A very large lode, containing a considerable quantity of ore has been laid open about a mile from the harbour. Near this a whim has been erected, which will be in operation in the course of a month. Having observed the inclination of the lode, Capt. Richards proposes to drive a shaft so as to meet it at 30 fms., when he expects to come upon a large mass of ore. Our readers are aware that the mime belongs almost wholly to a company in London. They are conducting their operations in a regular and scientific manner, which entails considerable expense at first, but will, if the mine turns out as it promises, be amply compensated by the facilities given at a future stage to the raising of ore. There are several lodes, the courses of which can be traced on the surface, but operations have at present been confined to one which is considered the champion. On this shafts are being sunk at several places, and ore, though not in quantity, has been obtained in all of them. The hardness of the country greatly retards the operations in some parts, but there are good hopes of an improvement in this respect. None greatly retards the operations in some parts, but there are good hopes of an improvement in this respect. None of the shafts are desper than 9 fms., which is above the water line. Some very substantial miners' cottages have been built, and we saw the parts of a large steam-engine which is about to be erected. The castings of this were very superior. Altogether we were convinced that the Worthing workings embrace a decided mineral country, and so soon as the mine has been preperly opened it bids fair to prove one of the most valuable in the country.— South Australian, May 9.

the country.—South Australian, May 9.

The Moniteur publishes a decree of the President of the Republic, reducing the export duty on east-iron from 25 centimes to 1 centimethe 100 kilogrammes.

Accounts from Algeria mention that the exploration of the metallurgical resources of the colony continued to attract attention. The discovery of copper would, it was believed, lead to the opening of a profitable branch of industry.

—Times of yesterday.—[We elsewhere notice the arrival of the first cargo of copper ore from Algeria for sale at Swanses.]

Ismense Casting.—A large party assembled at Mesers. Stillman and Allen's Novelty Ironworks, to witness the casting of the plate of the Humboldt, steamship, intended to ply between New York and Havre: it is of the largest size, being 30 feet 4 inches long, 9 feet wide, and 7 feet 4 inches high, including the condenser, for a 95-inch cylinder, of 9-feet stroke; the same size as the engines of the Allantic. About 40 tons of metal were used in the casting, which occupied a minute and a -half. At these works is also the mould of an 35-inch oscillating cylinder, of 9-feet stroke, which will be the first of the kind constructed in the Unitéd States, designed for a new steam-ship of Aspinwall's Pacific line, building by Mr. Wobb; and the mould for the cylinders of the cugines of a Charleston steam-ship, of the same size as the Northerner.

Mesers, Fox and Henderson, the contractors for the completing of the Cork and Bandon Rallway, have been declared contractors for making the wire rope of the electric telegraph to be laid down between Rogland and France.

### TREATMENT OF COPPER ORES .-- No. III.

By Jones Merchell, Esq., F.C.S., author of a Manual of Practical Assoying, &c. &c. The chief characteristic of the Welsh method is the facility offered for the rapid and sure working of all the ores and cupriferous products which mining or industrial art can furnish; no other process appears to posse this peculiarity, and to be so well adapted to the continuous extraction of copper contained in substances unexpectedly and continually varying or copper contained in substances mark peccedy and containantly varying in per centage and chemical composition. This method, considered in its minutest details, is not identical in all smelting-works; there exist slight variations either in manipulation or in the form of apparatus, according to the skill or the peculiar ideas of the manager, the period at which the works were established, the nature of the ores worked by preference, er the quality of the product required. Many modifications of apparatus and special processes have been tried during the last 20 years, and have often given rise to favourable opinions, which, however, after a time have not been confirmed, in consequence of which they have been for the greater part abandoned; some, however, are still employed in certain works, owing to some favourable circumstance which does not exist in other establishments. At present, however, it is not intended to enter into any descriptive details, or to offer any remarks on the various patented processes, as before describing the ordinary method it would be premature. In the last paper a summary of the treatment of ores in general was given; there are, however, other operations not there mentioned, such as the treamment of rich slags and other cupriferous products, occurring in a copper smelting-work. The introduction of these matters, of course, complicates the method of working, which, however, may be thus expressed. In juxta-position with the numbers which represent the order in which the operations are described, are the letters of the preceding analysis, establishing a relation between their operations and those practised on the continent.

1 a. Calcination of the Ores.—Calcination of sulphuretted ores of poor and medium per centage with pyritous gangue.

2 b. Melting for Osarse Meial.—Melting of poor ores, crude and roasted.

3 b. Calcination of the Ores.—Calcination of calcined coarse metal with rich ores.

4 c. Melting for Unite Metal.—Melting of calcined coarse metal with rich ores.

5 c. Remelting o in per centage and chemical composition. This method, considered in its

6 z. Remelting of Stags. — Fusion of rich slags from operations 4, 7, and 8. 7 c d. Rousting of White Metal. — Manufacture of extra white metal, or roasting of blu

Roasting for Regulus.—Roasting of extra white metal.

Roasting.—Manufacture of black copper, or roasting of ordinary white metal and

agulus. 10 D. Refining and Toughening.

a et al. Rosaling for Regulus.—Rosaling of extra white metal.

a et al. Rosaling for Regulus.—Rosaling of extra white metal.

a et al. Rosaling-Mannfacture or back copper, or rosaling of ordinary white metal and the state of the continental processes.—Ho other four being peculiar to Wales. Each of the three operations, under the head rosaling, consist of a calcination and a fusion. This intimate association of two operations, executed elsewhere separately, and in a distinct apparatus, is a great peculiarity of the Welsh method. A 10th operation, No. 6 = —the re-melting of rice has got many other operations—has no analogy among the continental processes. It has two principal objects. In the first place, it allows the extraction of the copper from slags, which, owing to the nature of the processes of smelting, must be rish in that metal; secondly, the quality of the copper thus produced is superior to that obtained from the ores themselves. The causes of this singular phenomenon will be explained when the operation itself is described.

All copper ores and cuprificous products may be subdivided according to their nature, their per centage, and the uses to which they are destined, into seven classes—alx comprising ores, properly so called, and a seventh containing all kinds of substances holding copper, which have been produced either in the smell-house inself or deswhere. The first class includes over the per centage of which varier from 3 to 15, and which, and the containing of the company of the company of the containing of the contai

the number of furnaces devoted to each, in the quantity, the yield of copper, or the chemical composition of the resulting compounds.

Nevertheless, from the chemical researches, and the calculations which will follow, it will be seen that some relation can be arrived at, especially concerning the composition of the ores, and a very near approach to a general mean of the results. These results were collected in a large smelting-works, in which about 47,000 tons of ore were treated annually, yielding about 6250 tons of copper. The following table shows the absolute and relative weights, as well as the yield of copper of each of the seven classes of ore treated every week:—

Relative Proportions and Mean Contents of the Seven Classes of Ore

De per	The second	Totals	and means		1.000	Charles State	912-1			0-137

The substances entering into the composition of the ores of copper may be divided in a metallurgical point of view into three groups:—1. Silica, the earthy oxides and ready formed silicates, all of which, after various reactions, nearly entirely pass into the slags.—2. The sulphuretted and oxidised compounds containing all the copper to be extracted during the process, and whose other elements pass into the slags, or are dissipated in the gaseous state.—3d, and lastly. The water and carbonic acid which are immediately volatilised by the first contact of heat, either in the calcination or smelting. The principal elements of the chemical composition of each of the three groups, and each of the classes of minerals, are shown in the following table:—

Chemical Composition of the Seven Classes of Ores.

In the following tables the grouping of the same substances in a different point of view is given, as well as the mineralogical composition of each of the ores. If we reflect that nearly all parts of the world furnish a portion of the ores smelted in Wales, it will be understood that these results possess the better that the treatment of the world for the wine the treatment of the world for the world for the wine the treatment of the world for the world for the world for the wine the treatment of the world for the of the ores smelted in Wales, it will be understood that these results possess much interest in the study of the geology of our planet; for they give the clearest idea we have, up to the present time, been enabled to procure concerning the relative abundance of the various natural compounds of copper in that portion of the terrestrial crust accessible to the labours of mankind. It is true that we possess many hundred analyses of every known variety of copper ore; but a consideration of these, without regard to the quantity of each ore attainable by the smelter, would be of little interest in a practical point of view. The following tables, however, completely supply this desideratum; for not only is the mineralogical composition given, but we have details of the quantities of each substance actually worked on the large scale, and, of course, giving an absolute idea of the mean composition of the copper ore of all climes, which are smelted in the neighbourhood of Swansea:—

[To be continued in next week's Mining Journal.]

The Virtuous Lady Mine—Origin of a Tradition.—Mrs. Bray, the novelist, gives the following explanation of the "peculiarly-shaped mineral," found only in the Virtuous Lady Mine, obtaining its name. She writes: "In my first local novel, of Fits of Fittyford, I introduced a character, which played no very gentle part, called Betsy Grimbal. In one of the towers of the abbey gateway leading to the abbot's grounds, now in the vicarage gardens, tradition averred that a woman so named had many years ago been murdered; and some stains on the side of the wall of a winding-stair were duly pronounced to be those of her blood. It struck me that I would make Betsy Grimbal into a character, for my novel; instead of murdering her, I made her to have been concerned in a deed of blood (founded on tradition), and which was supposed in my story to have occurred before the commencement of the tale. At the romantic mine of the Virtuous Lady, situated in the wildest and most beautiful spot on the Tavy, there are many side caves, like chambers, the mine being entered by a cavern, still visited by strangers, of a most Salvator-like description. Well, to make an end of all this, let me say, that I caused Betsy Grimbal and her companion in iniquity, George Stanwich, to conceal themselves for some time, by finding shelter in the cave of the Virtuous Lady Mine. A year or two after the publication of Fitz of Fitz ford, this old mine was worked anew, and as my story was popular among the natives here, the miners employed at the Virtuous Lady, not only named the peculiar-shaped mineral they there found, of which you have a specimen, 'Betsy Grimbal's slipper,' but likewise found out an apartment for her, and showed the cave and cells in the rock, pointing out to strangers where Betsy Grimbal had more especially made her dwelling. So much at last did they believe their own fiction respecting Betsy, that on my visiting the cavern with Mr. Bray, they very caperly offered to show me where she had concealed herself. And thus has an incident of my o

To LOGOMOTIVE MANUFACTURERS.—The Ministry of Public Works, in Austria, have offered a prize of 20,000 imperial ducats for a locomotive the most suitably constructed and adapted to convey goods and passengers on the Railway of the Semmering Mountains; and sor five other locomotives, which shall approach nearest to the first prize, the scms of 10,000, 9000, 8000, 7000, and 6000 imperial ducats each.

New Locomotive-Engine.—A new locomotive-engine, designed and patented by Messrs. M'Conochie and Claude, was tried on the Liverpool, Southport, and Crosby Railway, and following the trial of Messrs. England and Co.'s light-engine, excited much interest. Theological of the patentees was to combine lightness, power, and economy of fuel, and we believe they have succeeded in their aim. The engine (the Spitfire) conveyed a train of carriages from Waterloo-station to Southport at a rate of speed varying from 40 to 60 miles an hour, and, when at its highest velocity, manifested no oscillation whatever. The Spitfire is a four-wheeled engine, with 14-in. cylinders and 20-in. stroke, the driving-wheels being 5 ft. 6 in. The woking valves and pumps, which are usually crowded together underneath the boiler, are on the Spitfire placed outside the frames, so that for all the purposes of adjustment, cleaning, or repairs, they are as easy of accass as similar parts of a fixed engine. On the whole, the trial of the engine gave great satisfaction. It was constructed by Messrs. Forrester, of Vauxbail Foundry.—Liverpool Albion.

Brentford and South-Western.—A railway of 35, miles at a cost of 50,000L, is proposed from Brentford to Wornwood Scrubbs, to unite the South-Western, Great Western, and London and North-Western.

Wolverhampton, Chester, and Brekenhead Railway.—The call of

WOLVERHAMPTON, CHESTER, AND BREENHEAD RAILWAY.—The call of 201. made by Master Brougham, to payoff the liabilities, has been paid in full y the members of the provisional committee.

VALE OF NEATH AND SOUTH WALES BREWERY.—The liabilities of this nettaking are estimated by Mr. Norm, the official manager, at 120,0001.

MINES AND MINING .- No. IV

BY EVAN HOPKINS, C.E., F.G.S.

If a mine be worth working at all, it is worth an office in which the buiness of the mine may be transacted, totally free from share dealing. If it does not answer to carry on a mine under the management of an experienced mining man of business, it certainly cannot answer to leave it to the en-tire control of those whose business is inimical to, and incompatible with, the proceedings of legitimate mining. Some capitalists complain bitterly of brokers and mining agents. They say the former grind double-i. e., both the miner and the adventurer; and that they have always at command

the miner and the adventurer; and that they have always at command numerous mine agents ready to write reports, not on the merits of the mine, but to effect the object they have in view; and, consequently, they look at those persons with a degree of suspicion and horror.

A great deal of this proceeds from the want of judgment on the part of the capitalist. There are highly-respectable brokers, and there are also intelligent and upright mine agents, but they should be confined to their respective capacity. Before the capitalist enters into any mining speculation, or incurs any expenditure, it is necessary to satisfy himself that the undertaking is likely to be profitable, if prudently and systematically worked. This should be proved by men of extensive practical experience and reputation, and who hold themselves responsible, morally speaking, for the opinion given. When this is affirmed, and the conditions and dues moderate, the capitalists should not destroy the chance of success by handing over the management to improper and inexperienced hands. Were capitalists a little more discreet, and able to analyse those persons who are commonly employed to make reports, and eradicate from their minds their vain opinions, flattering hopes, false valuations, and confine them strictly to the reality, there would be fewer worthless mines, and perhaps a greater number of dividend mines at work. However true it is that some mine agents have acted improperly, causing a great waste of capital for the benefit of the few, and at the expense of the many, yet I maintain that the British, and more especially the Cornish miner, is a shrewd, intelligent, and persevering person, and has established for himself a name, from habits of industry and self-education, equal to that of any other nation, and frequently much more profitable to adventurers.

#### ON THE GEOLOGICAL AND MINERAL FEATURES OF CERTAIN DISTRICTS OF NORTH WALES.—No. III. BY ST. PIERRE FOLEY.

If we follow the opinions of Hutton, and other geological fire-worshippers we must conclude that North Wales, at some foregone period of the history of the world, must have been a true terra del fuego to form such a circle of vol-canos as Merioneth and Carnarvon in particular seem to be composed of. It we must conclude that North Wales, at some foregone period of the history of the world, must have been a true terra del fuego to form such a circle of vol-canos as Merioneth and Carnarvon in particular seem to be composed of. It is not, however, that you are to understand that these pyroboli were confined to the mere circumference of this circle, but rather that they sho forth from various parts within it, sometimes exhibiting, as it were, the apex of some conical furnace beneath, or, crater-like, having its concave sides ranged or formed from its very bottom to its rim in ponderous masses of hornblendic trap or segenitic tabular or parallelopiped shaped crystals; or, exhibiting portions of its radii, or diameters, in vast ledges along the tops of the mountains; or, spreading their thick and baking manties over some of the most valuable stratifications in the world, to be mined or quarried out in future ages for "man's sole use;" to roof his dwellings, and thus to shelter him from the Alpine storms, so, to be, prevalent in these glorious regions hereafter; or, for the thousand and one beautiful, useful, and ornamental purposes into which roof slate and its adjunct, slab rock, are now metamorphosed by the inventive genius and skilful handicraft of the mechanic of this age of wondrous appliances of powers; understood formerly as paintings of those spiritual visions which the poet alone could make palpable, and the writer of romance produce in solecisms of ideal reality. Just take a look at the very pretty, exact, and beautiful geological map of North Wales, lately published by, and for, the Geological Society, and you will at once perceive in the trappean, segnitic and porphyritic divisions of those portions of the grade palpable, and the writer of produce such mountainous effects, and then, perhaps, after a pause, you may meditarily whisper to yourself, Cis bono?

If you have the refined taste of a geologist, confined, however, to those divisions that have been at work to produce such mountain produces and then, is not, however, that you are to understand that these pyroboli were confined to

OXFORD UNIVERSITY.—The deputy reader in geology (Mr. H. E. Strickland, of Oriel) will deliver a course of about 12 lectures during the present term at the Clarendon-building. The lectures will commence on Tuesday the 22nd inst., and will be continued each Tuesday, Thursday, and Saturday. The deputy reader in mineralogy (Mr. M. H. N. Storey Maskelyne, of Wadham), also intends to give a course of lectures during the present term upon the chemical and physical characters of minerals. An introductory lecture will be delivered on Monday, the 21st inst., at the Museum in the Clarendon; and the course will be continued on every Monday and Friday.

GOVERNMENT TAX ON EXCUSION TRANS.—The Relivay Commissioners

GOVERNMENT TAX ON EXCURSION TRAINS,—The Railway Commissioners have remitted the tax upon excursion trains, where they carry passengers at less than 1d. per mile.

less than id. per mile.

New Vesta Match-Box.—A box for holding vesta matches, of very novel and ingenious formation, has been submitted to us, which possesses many advantages over those hitherto in use. It consists of a shallow metallic box, similar to a snuff box, with a deeply-serrated bottom. The two edges of this box, at opposite sides, are provided with flanges of peculiar form, in which the top, or lid, of the box slides, ridges being formed on the top of it, which correspond with the formation of the flanges, and prevent it from being totally withdrawn from the box, and maltreated, or lost, as is a common case with the ordinary boxes, although it permits it to be sufficiently opened to receive or replace the matches. This lid is provided with an orifice, for holding the match when lighted for sealing letters, &c. The whole is got up in a very neat, not to say ornamental, manner, and does great credit to the patentee, Mr. A. S. Stocker, and the licensees, Mesers Brocklebank and Finch.

Reveal Polyprograms Institution.—Mr. Geo. Barker has just commenced.

ROYAL POLYTECHNIC INSTITUTION.—Mr. Geo. Barker has just commenced, at this establishment, to give lactures on the ballad music of England. The ballads have been well selected, and the subject is treated in a popular and institutive manner, being altogether a highly musical treat. The lectures have been extremely well attended, and the audience appeared to highly relish the treat provided by the management.

## Mining Correspondence.

BRITISH MINES.

BRITISH MINES.

OTRED CONSOLS.—Field's engine-shaft is sunk to the 80 fathom level; and, on Saturday last, the 80 fm. level east and west were set to drive. As soon as these levels are extended 3 or 3 fathoms each way freen the shaft, we shall commence to fix level east of the sold either 10 fm. level. The lode in the 91 fm. level, east of the eagine-shaft, is fire to 50 fm. level, east of the eagine-shaft, is fire to 50 fm. level, east of the eagine-shaft, is from 6 to 7 fm. wide, and will yield 10 tons of copper ore per fathom—or, in other words, worth from 1204, to 1407, per fm. The lode in the 60 fathom level, east of the eagine-shaft, is from 6 to 7 fm. wide, and will yield 10 tons of copper ore per fathom—or, in other words, worth from 1204, to 1407, per fm. The lode in the 115 fathom level, east of Andrew's 120 fm. level east the lode is 2 fm. level east of 120 fm. level east to 120 fm. 120 fm. level east is 3 fm. wide, producing a little saving work; in Arsectiv winse, in this level, the lode will provide the producing a little saving work; in Arsectiv winse, in this level, the lode will provide the producing a little saving work; in Arsectiv winse, in this level, the lode will provide an love of ore per fm. We are driving by the side of the lode in the 95 fm. level east as 120 fm. level east in 120

ness produced so much value in ore—plainly showing that my former anticipations have been more than realised.

CARTHEW CONSOLS.—The sumpmen are getting on very well in sinking the engine—shaft, but have not yet taken down any lode since they commenced. The ode in the north end, 75 fm. level, is rather disordered at present; but in the south end, this level, the lode shows very well, and, are long, I doubt not will be found equally trouble with that above. We have again attempted to sink the north wines, 65 fm. evel, but find the water to plenging to entend with at present, and are compelled to seek, in mild the end below it is farther on. The lode in the conth end, 65 fm. level, containes as rich as ever; it is fact, the muse throughout appears very satisfactory, especially he tribute department, in every particular, and the whole of the machinery goes on as effect at could desire. The lode in the water has not yet sufficiently shated to enable us to proceed with the sinking of the middle shaft, but as soon as it does we shall lose not time it doing so. CEFN BRUNO.—The lode in the whim-shaft is 4 ft. wide, yielding 1½ ton fore per fm. The lode in the adit level west to 2 ft. wide, yielding 15 cwis. of ore per min, with a very promising appearance. Taylor's deep adit level is in good course for triving, as a good railread is laid down to the present end.

DEVON AND COURTENAY.—Since my last report, the ground in the 60 ast has taken a favourable turn, and the men have broken some good stones of ore from he lode, which I think will improve but still, being near the cross-course, we shall not be soon as the down of the presence of the soon get into disordered ground, takesfore we cannot expect any permanent change until ve have cut the lode on the east of it, when I hope, from the favourable appearance in 80, we shall have a good lode. The end west is poor. There is no change in the winze.

EAST CROWNDALE.—The middle shaft, since my last report, has improved—the lode still large and more timm. In the 40 ends, both

EAST SHARP TOR .- The lode in Hitchins's engine-shaft is without any

naterial alteration since last reported.

EAST WHEAL JOSIAH.—The adit level has been driven south on the curse of the totte for about 50 fms., in the present end of which it is about 5 fm. wide, composed principally of flockan, spar, mundic, and small stones of lead in places; for the sat 30 fms. driving, we have had a large strong promising looking jode, and we expect to at the east and west, or copper lode, in about 15 fms. further driving, at which point, in the east and west, or copper lode, in about 15 fms. further driving, at which point, in of epinion, there is a probability of its being productive; there will then be about 5 fms, to drive to reach the engine-stant, which I think may then be sunk for a great eal less expense then in our former attempt to do so.

mas, to drive to feach the elapsians. The same and a less expense then in our former attempt to do so.

ESGAIR LLEE.—The caunter lode in the deep adit, east of Owen's winze, us been taken down since my last; the lode is large, with a fine leader of ore, varying size from 3 to 6 in, wide, has a promising appearance, and will yield on an average full that or every fine the second of the lovel, for the last 5 ft. driving, will, I mak, produce 1 ton of ore per fm.—in fact, the ore is much more settled and solid than 1 we have ever seen before, and will stand the washing process well. Judging from 2 wo have ever seen before, and will stand the washing process well. Judging from the promising appearance of the lode in the level above, there is much reason to expect will improve as we proceed eastward. Since my last, we have taken down the lode in 13 fm. level, east from the surface, which is from 3 to 4 ft. wide, looking more proceed east of the looking and will now yield 10 cwts. of ore per fm. to stopes are at present looking quite as well as in my last, yielding on an average 3 ton ore per fm. We sampled on Saturday last 25 tons of lead ove.

CNOLINAN.—The 130 fm. level, west of Francis shaft, is 4 ft. wide, yielding

the 12 fm. level, east from the surface, which is from 3 to 4 ft. wide, looking more promising than for the last 2 or 3 fms. driving, and will now yield 10 ewis. of ore per fm. the stopes are at present looking quite as well as in my last, yielding on an average 2 ton of ore per fm. We sampled on Saturday last 26 tons of lead ore.

GOGINAN.—The 120 fm. level, west of Prancis shaft, is 4 ft. wide, yielding 14 ten of lead ore per fm. The 110, which is 30 fms. west of same shaft, is 6 ft. wide, yielding 14 ten of lead ore per fm. The 110, which is 30 fms. west of same shaft, is 6 ft. wide, yielding 2 to not ore per fm.; the stopes looking much as usual. The stopes at Levd-neydd are yielding about 1 ton of ore per fm. There were sampled, on the 8th inst. 60 tons, being the produce for the month.

HEIGNSTON DOWN CONSOLS.—The lode in the 45 fm. level is large, preducing some good stones of copper ore. The lode in the 35 fm. level is 2 ft. 6 in. Hellow 15 to 15 fm. level is 2 ft. 6 in. Hellow 15 to 15 fm. level is 2 ft. 6 in. Hellow 15 to 15 fm. level is 2 ft. 6 in. Hellow 15 to 15 fm. level is 2 ft. 6 in. Hellow 15 to 15 fm. level is 2 ft. 6 in. Hellow 15 to 15 fm. level is 2 ft. 6 in. Hellow 15 fm. level is 2 ft. 6 in. Hellow 15 fm. level is 2 ft. 6 in. Hellow 15 fm. level is 2 ft. 6 in. Hellow 15 fm. level is 2 ft. 6 in. Hellow 15 fm. level is 2 ft. 6 in. Hellow 15 fm. level 15 fm. level is 2 ft. 6 in. Hellow 15 fm. level 15 fm.

nd worth a ton of ore to the fathom.

LLWYNMALEES.—The 8 fm. level west is now in poor uncettled ground, as I do not expect much ere in this level until it is through this ground. The stopes were the 8 fm. level west, from \$ to 11 fms. west of western winze, look better than last septement. I neutring a plat at the bettom of London shaft, we have found a fine ranch of ore; and I am of opinion that we shall yet find, on further opening the plat, a cod fold. The 14 fm. level west improves every day, and will soon be in still better ore, we may judge from the shoot of ore gone down from the 8 fm. level west; so soon as the plat at the bottom of London shaft is completed, we shall be in a position for driving radfin level. We must also commence sinking the western winze, in order to lay pen ground for stopes on the bunch of ore under the 8 fathom level.

BENNYINGE GIA ZE AND DENTIPE (Thrown).

our \$4 fm. level. We must also commence saking the western wines, in sader to so open ground for stopes on the bunch of ore under the 8 fathom level.

PENTIRE GLAZE AND PENTIRE (UNITED).—The flat-rod engine-shaft is now 7 fms. below the 10 fm. level, ground asay wrought, leds about 5 ft. wide, composed of flookan, sort spar, and mundle, with some spots of lead and copper ores. In the 10 fm. level the lode is large, with lead throughout, and also a leader of about 5 in. wide, good sevel the lode is large, with lead throughout, and also a leader of about 5 in. wide, good work for lead; this level is on the middle lode. The stopes in the back of this level are looking well, and are improved since my last report, yielding a fair quantity of lead. At the south hill the sampmen have not yet cut through the lode in the 50 fm. level. In the 10 fm. level we are sinking a winze on the west lode, the lode in which is about 5 ft. wide, with a leader of about 9 in. wide, good work; this leader is of a different character to the other, and has produced much more lead; it is likely this lode is gone down to the west of the other, in the lower levels; this, however, we shall prove by sinking the present wince, which now produces a fair quantity of lead. On the whole, the mine is in an improving state, and bids fair of soon becoming a dividend-paying mine. the mine is in an improving state, and bids fair of soon becoming a dividend-paying mine. I propose sampling 30 tons of lead ore on Monday next, and, from our present prospects, we shall be able to raise is tons a month, with every probability of an increase, as we are daily laying open good ore ground. In the 10 fm. level, on the middle lode, which is from \$40.00 to mine the layer of the month of the man inde, and stands in whole ground from this level to the surface, which is 40 fms., this lode has not been cut anywhere in the upper levels, which after no our chance of getting large quantities of ore above; and when the engine-shall saink to another level, and the level driven under the productive ground, I have no desaits it will tell an important tale.

is sunk to another level, and the level driven under the productive ground, I have no disabit it will tell an important tale.

PETER TAVY AND MARY TAVY CONSOLS.—The sumpmen having completed timbering down the shaft, are now engaged in stoping from the 35 fm. level, where there is every appearance of a change of ground. The drawing machine works well, as also the engine-which is built to carry the shaft, if necessary, to the 159 fm. level.

SOUTH WHEAL TRELAWNY.—We are still cutting the cross-cut east of the engine-shaft, at the 69 fm. level, and ground pretty favourable; within this last wheak it has been discharging a little more water. With respect to the 50 fm. level north, on the course of the lode, west of the engine-shaft, it is heaved round to the east a great many degrees; how far it will continue so, I cambet my as yet; it is 124m, wide, unproductive—the ground is favourable. There is no decrease of water yet on the costsaning part of the boundary.

TRELAWNY.—At Phillips's shaft, in the 52 and north the lode is 3 feet wide, worth 10, per fm. In the 62 north the lode is 16, wide, worth 4t, per fm. At Tre-linking next week. In the 92 north the lode is 17, wide, worth 7t, per faithom: in the simking next week. In the 92 north the lode is 2 ft. wide, worth 7t, per faithom: in the simking next week. At the north mine Smith's shaft is sunk near 5 fms. below the 50 fm. level, and we have compared to the lode is and 15 mines level south the lode is 4 fm. wide, worth 81. per faithom; in the level is somewhat improved since last week. At the north mine Smith's shaft is sunk near 5 fms. below the 50 fm. level, and we have com-

menced driving south at this point, where the tode is 3 ft. wide, worth 6!, per fm. There is no alteration in the stopes worthy of notice since last report. We eampled as Thursday last two percels of silver-lead ore—No. 1 crop, computed 100 tons; No. 3, common, computed 45 tons.

TRELEIGH CONSOLS.—On Christee's leds, in the 90 fm. level, west of larden's shaft, the lode is 4 feet wide, and worth 22t, per fm.; in the stopes above the 0 fm. level, west of Harrie's winze, the lode is 3 ft. wide, and worth 24t, per fm.; in the stopes above the 90 fm. level winze, the lode is 3 ft. wide, and worth 24t, per fm.; in the stope below the 90 fm. level the lode is 15 fm, wide, with stones of ore. In the 80 fm. level, west of Garden's shaft, the lode is 2 ft. wide, with stones of ore; a the 80 fm. level, west of Garden's shaft, the lode is 20 in. wide, and worth 4t. per fathom; he 70 fm. level, west of Garden's shaft, the lode is 20 in. wide, and worth 4t. per fathom; he winze below the 70 fm. level is holed to the 80 fm. level. On Parent lode, in the 35 them level, east of Parent engine-shaft, the lode is 20 in. wide, with stones of ore, and them level, east of east of Parent engine-shaft, the lode is 20 in. wide, with stones of ore, and them level, east of the fm. level, east of ditto, the lode is disordered by a looking more kindly. In the 40 fm. level, east of ditto, the lode is done was on a branch, the de is 1 ft. wide, with stones of ore. Burgean's shaft from surface, on the middle lode, sinking in the country.

WARLEGGAN CONSOLS.—Our new adit-shaft is sunk 12 fms. 2 ft. 6 in.

staking in the country.

WARLEGGAN CONSOLS.—Our new adit-ahaft is sunk 12 fms. 2 ft. 6 in., and we expect shortly to hole the adit. The shallow level is down west of the trial shaft fms. 4 ft., through a good lode; we have set the backs to stope by 4 men and 12 boys, t is., per fm. The repairs of the wheel-pit are progressing favourably, and we hope to summe stamping in about a fortnight.

at 18s. per fm. The repairs of the wheel-pit are progressing favourably, and we hope to resume stamping in about a fortnight.

WELLINGTON.—The lode in the 50 fm. level, east of the engine-abaft, is 18 inches wide, producing some rich copper ore; in the same level west the lode is from 18 in. to 2 ft. wide, and of just the same appearance as that of the 50 fm. level east; the 18 in. to 2 ft. wide, and of just the same appearance. The lode in the 43 fm. level west lode in these levels presents a favourable appearance. The lode in the 43 fm. level west is without change since my last report; the lode in the 43 fathous level, east of Parcolly shaft, is 1 ft. wide, and at present unproductive. The lode in the winze sinking under the 32, east of Parcolly shaft, is 1 ft. wide, worth for copper and in 13/, per fm., but this 32, east of Parcolly shaft, is 1 ft. wide, worth for copper and the salt level, east of the western whim-shaft, is 18 in. wide, worth for copper or 4. per fm. The lode in the western all endis 10 in. wide, principally gossan and capels. The lode in the salt level, east of said shaft, is suspended until the rise over copper or 2.0, per fm. The 10 fm. level, west of this shaft, is suspended until the rise over this level is communicated to the sailt level. The lode in the rise is 18 in. wide, worth for copper ore 18.1 per fm. The lode in the water whim-shaft is 3 ft. wide, worth the per copper ore 18.1 per fm. The lode in the water whim-shaft is 3 ft. wide, worth 20.0 per fm, but cannot be sunk deeper until the 42 fathom level, west of the engine-shaft was a water; here we have cumk 7 fm. 6 ins. below the adit level, at which level we have water; here we have cumk 7 fm. 6 ins. below the adit level, at which level we have water; here we have cumt north, in the adit level, is since the last report much fairer for driving.

WEST GOGINAN.—The engine-shaft is now about 10 ft. below the 15 fm. level; the lode from 5 to 6 fact wide, composed of killas and spar, with several small branches of lead ore.

WEST PHENIX (NEAR LISKEARD).—Additional men have been placed on the mine this week, the engine and engine-bouse is about to be erected, and from the nature of the lode in this sett, as compared with the same lode in the Phenix, on which so much rich ore is now being raised, there is no doubt but that the West Phonix Mine will prove a highly rich and profitable adventure, and at a shallow depth. The adven-turers are determined to work the mine with spirit and economy.

wern are determined to work the mine with spirit and economy.

WEST WHEAL JEWEL.—We have not taken down the lode in either the winze or level in the past week on wheat Jewel lode. The 57 fathom level, west of the does cross-course, on Telearne tin lode, is worth 284, per fm.; ditto east, on the same lode, is worth 154, per fm.; the stope in the 30 fm. level, west of Quarry shaft, on the same lode, is worth 10f. per fm.; the stopes in the back of the 137 fathon week, west of Pryor's winze, on the same lode, are worth 184, per fm.; the stopes in the bottom of the 12 fm. level, east of Tregoning's shaft, on the same lode, are worth 285, per fm.; the stopes in the bottom of the 256 per fm. These stopes are working on tribute.

WHEAL PRANCO.—The lode in the 52 fm. level, east of the engine-shaft.

WORTH 20% per fin. These stopes are working on tribute.

WHFAL FRANCO.—The lose in the 62 fm. level, east of the engine-shaft, is 23 ft. wide, composed principally of ore, peach, and mursile—a very promising lode, having much improved within the last fm. in driving. The lode in the 32 fm. level, east of Spry's shaft, is about 4 ft. wide, the north part of which for about 2 ft. wide, is producing fair work. The pitches, on the whole, are looking much as usual. I expect to-morrow to sample the September oves, computed at 36 tons.

The work of ample the September ores, computed at 96 tons.

WHEAL FRIENDSHIP.—The stopes are not looking quite so good as they were. The 170 fm. level east, on south branch, is a little improved, producing good stones of ore. A rise in the back of the 40, east of Brenton's shaft, on south lode, is producing it is no fore per fm. The actit level, east of Brenton's, is kindly. The lode is cut in the 120 fm. level cross-cut, south from Taylor's shaft; it is large, composed of strong caple, very hard with spots of ore, and expected to improve, as a winze from the 900 fm. level is in a kindly lode, producing it ton of ore per fm. The tribute pitches are much as usual, but the sampling will be rather short this month.

WHEAL HAMLYN.—We have sunk in the western of the shaft about 3 ft., and have driven west about 6 ft., where the lode is improved, and I must say it is a very promising one indeed. I have taken our men from the simf altogether, and have put them to work in the addit end, where I think they will cut the lode in 3 fathoms driving, when we shall drive on its course, so as to hole to the shaft, where we shall sink and prove this large shendld lode in depth.

sem to work in the adit end, where I think they will cut the look in Janious division, then we shall drive on its course, so as to look to the shaft, where we shall sink and prove his large splendid lode in depth.

WHEAL HARRIS.—Since my last report, we have sunk a pit about 12 ft. where you have sunk a pit about 12 ft. where you have some of lead and antiment, which and the sharps in the underlie will lengthen the cross-cut south upon the 25 fm. level from his charge in the underlie will lengthen the cross-cut south upon the 25 fm. level from 5 to 20 fms., according to its present underlie. We have commenced sinking a pit wo on the back of the north and south lode, to prove whether or not this lold has hanged its declination also.

changed its declination also.

— Cet. 16.—We have sunk on the east and west lode about 15 ft., the lode in which is 2 ft. wide, composed principally of antimony, lead, goesan, and spar; in the last 3 ft. sinking we broke some large stones (weighing from 40 to 3c hs. per stone) of antimony, with a small proportion of lead and silver; this lode appears we depth to have a less declination, and I am of opinion that we shall not have to drive to re-sh it at the 25 fm. level so far as we anticipated; the ground is very much improved for driving, and is also become much better than we have ever seen it; this strengthens my opinion that we are not far from the lode. We are costeaning to cut the north and south lode, but have not reached it yes, although daily expecting to do so.

WHEAT PENHALE.—Since my least report we have not a least report we have not a least record.

WHEAL PENHALE.—Since my last report we have not taken down a great pertion of the lode in the south end, 40 fm. level; but yet enough has been taken down to show an improvement in it in the production of ore. No lode has been taken down in the north end subsequent to my last communication. The lode in the 30 fm. level end north has been disordered by a slide, but is again showing itself in a more require state. The eaunter lode, it will be rememberd, is now being worked on tribute, and a little of it only has been broken down by the tributers; but I fear it is not looking as well as last noticed. The north end, 20 fm. level, continues to look well, the whole of which is being saved for work. We have again commenced driving the 10 fm. level south, which is being saved for work. We have again commenced driving the 10 fm. level south, and in it we find a very promising lede indeed, about 14 ft. wide, producing very good stones of work (lead). I intend to have this end kept on, to prove the now southerly part of the naine, which is opening very satisfactorily. In the tribute department I find no great change of late.

## FOREIGN MINES.

THE AUSTRALIAN MINING COMPANY :-

THE AUSTRALIAN MINING COMPANY:—

Tungkillo, June 7.—Anatey's setam-engine having now drained out the water from a national control of the water from the same mon to land all their rubbish, and drive the whim horse—a shed being made near the whim for shelter for the horse, which will remain 12 hours, and to draw the rubbish when wanted. The steam-engine is going s-fect stroke, and about four the rubbish when wanted. The steam-engine is going s-fect stroke, and about four the rubbish when wanted. The steam-engine is going s-fect stroke, and about four the rubbish when wanted. The steam-engine is going s-fect stroke, and about four grades to the minute, to keep the shaft drained, drawing a 7-inch pump, and is consumed ing a ton of wood in 24 hours, the cost of which is 10s.; thus we have cutire command to fine water, and with such a force we shall hasten the sinking, so that, in about four months, we are likely to reach the 20 fm. itself, at which it will be proper to cross-cut to inouths, we are likely to reach the 20 fm. itself, and while produce call the control of the staff, from which stones containing ore were whim-shaft we have completed from surface to fail, and shall enaploy four men to sink whim-shaft we have completed from surface to fail, and shall enaploy four men to sink whim-shaft we have completed from surface to fail, and shall enaploy four men to sink whim-shaft we have completed from surface to fail, and shall enaploy four men to sink whim-shaft we have completed from surface to sail, and shall enaploy four men to sink whim-shaft we have completed from surface to sail, and shall enaploy four men to sink whim-shaft we have shad to sail and the sail of the

THE WORTHING MINING COMPANY :-

THE WORTHING MINING CORPANT:—

June 23.—Since my despatches to the bard, we have let Hodgkinson's winze, upon 10s. tribute, for a month. We are again diving south, and also driving for the lode at the gossan shaft; after cutting which we shall try to sink a winse upon the Middle Gully; the gossan shaft; as too heavy for us, we shall but this exten to open the ground at the entrance to Hodgkinson's winze. The cagits-shaft, at Middle Gully, is stopped for water; they have just got upon yellow soft groundagain, but the water overpowered them from the lode side, and we must wait until the whim is up.

LINARES MINES.—The following has been received from Capt. Curry:—

Pool Ancho, Oct. 5.—Sam Antonio winzebas been drained to the bottom, which was sank by the old men something short of 4 has, below the 45 fm, level. We have let this winze to sink to six Englishmen, they empoying six Spanish labourers, at 10t, and half winze for sink to six Englishmen, they empoying six Spanish labourers, at 10t, and half winze areal per arrots for all lead broken, and 8t, premium if completed to a depth of 10 fms. 4 ft. by the end of Nov. In the bottom of this winner the tote is large and sort, with very fine stones of lead occasionally—present depth 6 fms. During the past month we have opened a rise and cut a plat at La Manca vinze, prepared for and fixed horizontal rods

to drain the water from this wince, and which we hope to get to work in two or three days from this time. This place being connected at the bottom with the wince and, old workings at San Pablo, we trust but a small part of the mine will be left for us to drain by manual labour; there is another wince and come workings to the east of San Pablonamely, Las Mieves, which we purpose unwatering, by creeting tackies on it, and which will be done with the least delay possible. San Juan is now sunk to a depth of 16 varue below the 31 fm. level—ground rather harder; present price 350 rs. per vars. Sin we hadt is now down 19 varsa below the 31; here the lade is large, with occasional stones. will be done with the least of San Pis namely, Las Misves, which we purpose anwatering, by erecting tackies on it, and a will be done with the least delay possible. San Juan is now sunk to a depth of 16: below the 31 fm. level—ground rather harder; present price 350 rs. per vara. Sa shaft is now down 19 varas below the 31; here the lade is large, with occasional, s. of lead, but not enough to value; we expect to communicate this shaft with the devel during the present month; present price 350 rs. per vara. The 31 ms. level has been driven in the past month 8 varas; here we have a vergoromizing lode, vide, with a leader of saving work; If, whice on the north part—worth 1 ton to a fatt present price for driving 200 rs. per vara. The 45 ms. level east has been driven month 6 varas; in this level the lode is large, but unproductive; and here I would to remark, that our 31 fm. level was unproductive on the part over where our 45 has reached, and we may confidently expect an improvement in the latter sed when ar under the ground we are now opening at the former level; present price per vara 2. I am happy in being able to inform you, that our tribute department still continue look well; we have again let the same number of contracts at an average tribute of part on. Our raisings for Sept. are just as estimated—vis. 100 tons, and we may can be about the same quantity for the present mouth, provided we are able to set our Engment to infik Wilson's shaft, where we have a splendid lode to commence with. I mean are at present mephod in proparing the work about La Manea wines. Whe above wines shall have been drained, we purpose shiring it simultaneously with Antonio, and when deep enough from each, to drive east and west, so as to open a level under the whole of the old men's workings. Our engine and pitwork, Se., ar going on remarkably well, and all our operations above and below progressing satisfactors.

## CARADON VALE MINING COMPANY.

CARADON VALE MINING COMPANY.

The usual two-monthly meeting of adventurers was held at Exeter, on Friday, the 11th inst., Light, Col. Thosteson in the chair.

The accounts were presented, showing—Balance last account, 951, 19a, 2d. pc cost-sheet for July, 1861; ditto for August, including sundries, 1931, 12a, 1d. and 44. 4a, 3d.—Cash received on account of calls, 415t.; leaving balance in hand, 591, 4a, 3d.—A call of 7a, 5d. per share was made, payable in two instalments—So, on the 29th Oct., and 2a, 5d. on the 30th Nov. The committee of management were re-elected, and 40 shares were forfeited, which are to be sold for the benefit of the company.—The following reports were read:

Our engine-shaft is in course of sinking below the 14 fm. level, by nine men; the price of 1 fm. would be, if set separately, 91. We are new sinking for beares and cisterns, &c.; they have to sink 9 ft. for this purpose. Also a pent-house to put in, and footway, and the lift to heave. As soon as these works are completed, in about a fortugith and three days, we shall commence sinking in right good earnest. I expect we shall progress about 4 fms. per month, and I would recommend that it be sunk 14 fm. beture we begin to drive again. The kills, both in shaff and ends, is of a superior character to any I have seen in this district. I have let the 14 fathom level to drive north, towards what we have samed. Ttherely's lode, by four men, at 21. 10a, per fm.; west of ditto, on Tracer's food, to cut through the cross-course, &c., by four men, at 31. 10a, per fm.; and east of ditto, by four man, at 24. per fm. These settings are only for one week, as the general setting is on Saturday next. I hope to be in a position to furnish you with a more adisfactory report shortly.—J. Sxxsors.

I shall be enabled to sand you a better report of this mine in about a week or 10 days; but time they will have driven a little on the lode west, through the cross-course, but the sund of the lode west, through the cross-course solid copper that are running in the

## EAST POOL MINING COMPANY.

EAST POOL MINING COMPANY.

The usual two-monthly meeting was held at the mine, on Tuesday, the 15th inst., when the statement of accounts was presented, showing—Balance last account, 5477. 12s. 5d.; labour cost for August and September, 7574. 9s. 3d.; merchants' bills, 2394. 15s. 5d.; Lady Bassett's dues on ores credited to this account, 234. 14s. — 15686. 2s. 4d.—Copper ores sold August 1, 5394. 16s. 2d.; arsenic sold August 23, 75t. 3s.; tin sold October 14, 967. 2s. 2d.; two months' water drainage, 120t.: leaving balance aga inst adventurers of 7371. Ls.—It was resolved that Mr. Henry Grylls be authorised to receive the dividend on Mr. P. V. Robinson's estate, due to the East Pool Mine adventurers, and give a receipt in full on behalf of the said adventurers on the balance of 1183t. 5s. 6d., as recognised by Mr. T. P. Tyack, in his letter of the 15th inst., addressed to Mr. Alfred Richards, and that a copy of this resolution be forthwith sent to Mr. Tyack. The following report was read to the meeting:

The 120 fm. level is driven west of engine—shaft about 52 mm.; the lode in the present ends is 2 ft. wide, containing stones of copper. The 100 fm. level is driven west of the unique-shaft about 128 fms.; the lode in the present ends is 2 ft. wide, containing stones of copper. The 100 fm. level is driven west of engine-shaft about 128 fms.; the lode in the present end is 2 ft. wide, containing stones of copper. The 100 fm. level is driven west of engine-shaft about 128 fms.; the lode in the present end is 2 ft. wide, worth 6t. per fm. The lode in the present end is 2 ft. wide, worth 6t. per fm. The lode in the view about 177 fms.; the lode in the present end is 4 ft. wide, worth 6t. per fm. The lode in the view about 177 fms.; the lode in the present end is 4 ft. wide, worth 6t. per fm. The lode in the view about 177 fms.; the lode in the present end is 4 ft. wide, worth 6t. per fm. The lode in the view of the wines, are worth 10t. per fm. The lode in the view about 177 fms.; the lode in the present end is 4 f

## NORTH BULLER MINING COMPANY.

NORTH BULLER MINING COMPANY.

The quarterly general meeting was held at the offices, Old Brond-street, on the 12th inst., Thomas King, Esq., in the chair.

The Secretary stated that at the last general meeting there was a balance in hand of 944.0s.24, since which there had been received in calls 6122, making together 4204.7s. 10d., leaving balance in favour of mine, 1854.12s.4d. A call of 1L per share was made.

The Charrman explained to the adventurers it was intended to sink King's shaft and Louisa's shaft simultaneously, by means of fiat-rods, and for this purpose they have ordered a new 86-inch cylinder steam-engine, with all the latest improvements, to be made by Messrs. Harvey and Co., of Hayle Foundry. Everything at the mine was progressing in the most spiried and satisfactory manner, with dise regard to economy and the shareholders' interest, and for the present quarter there was nothing charged for London expenses or management. He (the chairman) said he had done everything in his power for the welfare and prosperity of the mine. A few months' patience, to get down the shart to the proper depth to cut the lodes, and he felt confident, surrounded as North Buller was by the best mines in the county, that it would not be inferior to any of them.—The following report, from the agent, was read to the meeting:—Oct. 9.—Louisa new engine-shaft is sunk is fins. from surface in very favourable greand—present price for sinking 61.0s. per fathom; since commencing this shaft, we have unexpectedly discovered two very promising lodes, underlying north, the one in the present bottom being 2ft. wide, composed of beautiful gossan and quartz; this lode, from its great inclination north, must, in a few fathoms, form a janction with the other, so that there is every reason to believe we shall have a good and productive lode, considering the number of lodes we have in the set; and the favourable strats through which they pass, must surely lead to something very good. The cutting down of King's shaft will be completed by the

STRAY PARK, CAMBORNE VEAN, AND WHEAL FRANCIS MINES. At a general meeting of adventurers, held at the mines on the 11th inst., the cecounts for July and August were presented, showing—

| Salesis advanced of all | Salesis | Salesis

fm., the linds is t ft. wide, yielding good stones of ore. In the 100 end, driving west, by 6 man, at 101, per fm., the lode is 3 ft. wide, yielding 3 tons of ore per fm.; in the stopes below the 100 fm. level, east of winze, by 6 men, at 41. 10s, per fm., the lode is 3 ft. wide, yielding 3 tons of ore per fm.; in the stopes below the 100 fm. level, west of winze, by 6 men, at 111. 10s, per fm., the lode is 3 ft. wide, yielding 3 tons of ore per fm. In the 110 end, driving west, by 6 men, at 111. 10s, per fm., the lode is 1 ft. wide, yielding stones of ore. In the 120 end, driving lowest, by 4 men, at 121, per fm., the lode is 1 ft. wide, yielding stones of ore. In the 180 end, driving west, by 4 men, at 121, per fm., the lode is 1 ft. wide, yielding 4 ton of ore per fm.; in the 180 end, driving east, by 6 men, at 212 per fm., the lode is 3 ft. wide, yielding 2 tons of ore per fm.; in the winze sinking below the 180 fm. level, by 6 men, at 32 men, at 32 per fm., the lode is 4 ft. wide, yielding 4 tons of ore per fm.; the cross-cut driving north at the 180 fm. level, by 4 men, at 111. per fm., is in from shaft 77 fms. The cross-cut driving south at the 200 fm. level, by 8 men, at 132, per fm., is in from shaft 77 fms. The cross-cut driving south at the 200 fm. level, by 8 men, at 132 per fm., is in from shaft 72 fms. The cross-cut driving south at the 200 fm. level, by 8 men, at 132 per fm., is in from shaft 72 fms. The cross-cut driving south at the 200 fm. level, by 8 men, at 132 per fm., is in from shaft 72 fper fm., the lode is small and unproductive.

### KIRKCUDBRIGHTSHIRE MINING COMPANY.

KIRKCUDBRIGHTSHIRE MINING COMPANY.

The monthly meeting of shareholders was held at the offices, on Tuesday, when the accounts were presented and passed, showing—Cost for September, 5294. Is. 1d.; balance last account, 1701. Is. 1d.—6991. 2s. 2d.—Ores aold, 12th Sept., 4131. ISa: leaving an apparent balance against the mine of 2804, 9s. 2d. It was explained that 40 tons of lead ore, sold on the 10th inst. (part of 50 tons raised in the past month, the expanse of raising and dressing of which was included in the cost-sheet charge for Sept.), was not yet in cash, and, therefore, not placed as an asset in the accounts, otherwise the real statement would show a balance of upwards of 2002 in favour of the company.

The agent's report gave a very favourable account of the state and prospects of the mine (Cairnamore), and explained that the heavy cost charged for Sept. arose from the extra merchants' bills on account of the new steam-engine. In future the monthly cost will be much lighter; and whilst the agent looks forward to regular and greatly diminished expenses, he confidently expects, as more ground is opened, much greater quantities of ore will be raised.

## WEST PHŒNIX MINING COMPANY.

WEST PHENIX MINING COMPANY.

At a meeting of shareholders, held at the offices of the company, High-street, Exeter, on Monday, the 14th instant.

JEFFERY LANG, ESq., M.D., in the chair,
Several reports and other documents having been read, whereby the evidence appeared to be conclusive as regards the West Phosnix lode being the same as the Phosnix, on which an immense quantity of rich ore is now raising; and it being fully demonstrated to the meeting that similar large deposits positively exist in the West Phosnix sett, and at a very shallow depth, it was resolved that the mine be proceeded with immediately, and that the utmost economy be observed in carrying on the works. The following gentlemen were appointed the committee, to carry such object into effect:—Messrs. J. Lang, M.D., John Porter, E. Suter, W. Milton, W. Whitchurch, C. Titherley, H. Vatcher, J. S. Higgs, C. Richards, W. Channing, W. L. Jones, R. Serjeant, and W. Balle.—The committee have offered their services gratuitously.

#### WHEAL SETON MINING COMPANY.

WHEAL SETON MINING COMPANY.

The usual two-monthly meeting of adventurers was held on Monday, the 14th inst., when a dividend of 5*l*. per share was made, and the following statement of accounts presented and passed, showing—By copper ore sold July 4, 1841*l*. 17s. 11d.; ditto August 1, 2586*l*. 18s. 2d. (less lord's dues, Trevorade, 1794. 18s. 2d.) = 4246*l*. 17s. 11d.; by copper ore sold (less lord's dues, western ground, 7*l*. 9s.), 104*l*. 6s. = 4358*l*. 8s. 11d.—Amount of cost for July month, 1408*l*. 3s. 2d.; ditto for August, 1338*l*. 3s. 1d.; merchants' bills, 840*l*. 10s. 6d. = 3576*l*. 16s. 9d.—showing profit, 776*l*. 7s. 2d.; add balance of last account, 307*l*. 8s.= 1083*l*. 15s. 2d.—Dividend of 5*l*. par share, 990*l*.: leaving balance to next account, 93*l*. 15s. 2d.

## WHEAL BLENCOWE MINING COMPANY.

WHEAL BLENCOWE MINING COMPANY.

A general meeting of shareholders was held at the mine, on Thursday, the 3d inst.

Mr. W. P. ASE, in the chair.

The following statement of accounts was presented, showing—Balance due to purser at the last meeting, 86f. 16s.; cost for May, 26f. 0s. 8d.; ditto June, 60f. 3s. 10d.; ditto June, 60f. 3s. 10d.; ditto July, 46f. 17s. 4d.; merchanta\* and other bills, 26f. 14s. 3d.—245f. 12s. 1d.—Tin sold, July 3f (less lord's dues, 3f. 15s. 5d.), 52f. 16s. 1d.; carriage, 15s. 8d.; tin sold September 7 (less lord's dues, 1f. 17s. 7d.), 26f. 6s. 9d.; carriage, 6s. 1d.; received on account of call made July 27, 75f.—leaves balance due to purser, 65f. 12s. 1d. A call of 7s. per share was made.

The following report, from the agent, was read to the meeting:—

Oct. 14.—At our last meeting I reported our having a hard channel of ground to pass through in driving the 20 fm. level, and that at the time of the meeting it appeared to be more favourable, which led me to hope that we should, cat the softhermoat lodes in about six weeks; in that hope, I regret to say, I was disappointed, the ground proving, and still continues to prove, so hard, that I cannot calculate on reaching these lodes in less than a month from this time. If was suggested at the last meeting that a shart should be surface with a greater facility; this has been accomplished, and it is found to be of great advantage. We continue to raise some tin from the old south lode. We can know nothing of the seat and west lodes until they are cut, which I am anxious to have done, as I have a good hope that they will be found productive.

Sin.—I have frequently heard mine adventurers complain that the results of mineral operations do not justify the reports which the agents have given of them. Now, this diversity must arise from one of the following reasons:—Ignorance on the part of the reporter, or intentional misrepresentation, for selfash or party purposes, or over sanguine anticipations. Men who are consciously ignorant of the work of a reporter, should have the honesty to decline the office; those who misrepresent should also learn honesty, and the over sanguine should moderate their expectations, and be more cool in their judgment on the character of the lodes. It is frequently the case that mine agents promise certain profits within given periods, and state that certain lodes will yield so many tons of ore per fin., which afterwards are found to be almost worthless. When promises of such kind are given, adventurers naturally expect shortly to hear of the sale of a parcel of ore; but, alia! they often look in vain. I might adduce examples in point, but I forbear, and will conclude this letter by tendering a word of advice to mine agents. It is this—always give as faithful a report as you possibly can, and rather keep within than go beyond the probable production of the mine.—A Miner: Oct. 16.

## THE ARTICLE ON THE DEVON GREAT CONSOLS.

THE ARTICLE ON THE DEVON GREAT CONSOLS.

Sin,—I observe that it is the intention of Mr. Murchison to reprint the history of the proceedings of these important mines. However interesting such a compilation may be to the shareholders of the Devon Great Consols, yet I think the readers of your useful and scientific Journal have a right to expect something more original from the pen of Mr. Murchison. I therefore trust that, in the event of another edition, Mr. Murchison will satisfy Captain Eunor, and others, by entering into the geological character of the bunches of ore, and other matters connected with general mining, and thus render it still more worthy of, for a second time, so large a space in your valuable paper.

J. C. Tavistock, Oct. 17.

## CARADON WHEAL HOOPER.

CARADON WHEAL HOOPER.

Sir.—I was on this mine to-day, and examined the stuff broken from the lodes, and Ithought what a pity it was that such a sett should be abandoned; -richer yellow copper I never saw than I have broken from some of the lodes, and, a listle to the north-east of the engine-shaft, South Caradon party are taking up some good copper. If any company felt inclined to take up the mine, and lay out about 3000t, I would engage to get them a good return. There is an engine-house erected with the best of materials, well-built, and large enough to take in a 50-inch cylinder-engine, a good smiths shop, account-house, material-house, and powder-house; a good shaft sunk to the 66 fm. level below the surface, and the lodes not cut at that level; there are three lodes cross-cutted in the 58, with copper in each—these three will meet about the 60 fm. level; there is also a very kindly lode north of the shaft in the 50—this lode has not been seen under the 50 fm. level, and a cross-cut has been put out in the 66 fm. level, within 2 or 3 fms. to the last lode.

John Skymour.

EVMOOD WHEAL There

## EXMOOR WHEAL ELIZA MINE.

Sin,—For some time past the Journal has contained letters from Mr. Ennor, respecting various mines. In one communication, dated 31st August, reference is made to Tincroft, Wheal Golden, and a splendid lode at Bridestowe. The remarks on Tincroft brought no reply, the Cornish adventurers knowing somes.

is made to Tincroft, Wheal Golden, and a spiendid lode at Bridestowe. The remarks on Tincroft brought no reply, the Cornish adventurers knowing something of the writer. Mr. Thorn, of Barnstaple, condescended to impeach the statement respecting Wheal Golden; and an "Old Miner" set Mr. Ennor somewhat right in reference to the geology of Bridestowe.

What does Mr. Ennor mean, when he states that "if tin is fourd near Bridestowe, I should set down the old theory in this district to be incorrect?" Does he mean his own theory, exploded by the tin lodes of the district? It cannot be that of Sir H. De la Beche, which is confirmed by the results. Mr. Ennor, not content with the exposure of his errors, writes again, in the Journal of Sept. 21, respecting Exmoor Eliza; the chief part of his letter consists of a charge of concealment of the reporter's name, as if it was intentional. He well knew it was withheld, as all names are from reports, as the paragraph would have thereby come under the head of advertisements. So much for the honesty of the impeachment. The Journal of Oct. 5 brings a rejoinder from Mr. Ennor, and the same page contains a statement respecting Treburget Lead Mine, in the parish of St. Teath, Cornwall. It was in this mine that Mr. Ennor, through paternal interest (for he never was a practical miner), became an agest; he was ambacquently engaged at a little antimony mine in the north of Cornwall. These circumstances, together with his employment at the Delabole Slate Quarries, are barely sufficient qualifications to entitle him to give dogmatical opinions,

either in geology or the nature of metalliferous veins—elate and lead, perhaps, excepted. Many practical agents (not quarrymen), of high standing in the mining world, have inspected Exmoor Wheal Eliza, and I may venture to assert, without fear of contradiction, that not one of them has given any other than a highly encouraging epinion, their judgments having been formed after a careful examination of the lodes and the surrounding strata. When I see such gossan as Exmoor farmishes covering the backs of the lodes, and other indications—and no mine in this county can preduce better—I conclude this to be one of the effects of a large course of copper. I concur generally in the report of Capt. Fezzey, as inserted in the Journal of the 14th Sept.; and must repeat, that such indications as this mine presents are seldom met with. My opinion is that of a miner of 40 years attanding, having been nearly 30 years a tributer. A practical miner need not be "lynx eyed" to conclude that in depth we shall obtain large quantities of copper, as we have hitherto found that the lodes and branches contain more copper the deeper we sink.

Peter Tay, October 9, 1850.

RICHARD MOORE.

MINING IN SCOTLAND .- It is with much pleasure we observe that a highly respectable company has just been formed, for the purpose of working the Black Craig and Craigton Lead Mines, near Newton Stewart, in Kirkcudbrightshire. The sett is one of the most extensive in Scotland, being three miles on the course of the main lode, and is held under lease for 31 years, at 1-14th dues. The mines formerly returned profits to the amount of 25,000t, per annum, but, owing to imperfect machinery, they were for some time stopped. The old workings consisted of numerous shafts, sunk to various depths, but only two of them below the adit level; and, therefore, it is only fair to presume that, with machinery and a judicious outlay of capital, considerable quantities of ore will be raised at greater depths. The reports of parties who have inspected the mines all concuron this point, and Mr. E. A. Crouch, of Liskaard, states, "on the whole, the adventure affords prospects of success rarely met with." The mines are conducted on the Cost-book System, and every inquiry is courted by the company, to which we heartily wish success. We are always glad to see energy and capital directed to the advancement of mining, but ever most pleased when applied to the exploration of a new field; it convinces us that the opinions we have ever expressed upon the safe and profitable character of mining speculations, when fairly carried out, are beginning to be entertained by the public; and we shall watch the progress of the Black Craig and Craigton Mines with no little interest, seeing that the energies of the company will be directed to the development of the mineral riches of a country which, though hitherto but little known to the English capitalist, we have ever believed to be well worthy his attention.

CRAIG-Y-MWYN LEAD MINE.—Operations for the development of this mine. the course of the main lode, and is held under lease for 31 years, at 1-14th dues

hittle known to the English capitalist, we have ever observed to be well worthy his attention.

Craig-y-Mwyn Lead Mine.—Operations for the development of this mine, situate in Llanrhiadr, Montgomeryshire, a descriptive notice of which appeared in a former Number, are proceeding very satisfactorily. The sett, it may be recollected, comprises an area of four square miles, in which space the "lead mountain." Craig-y-Mwyn, is included. Four levels had been driven, the reports of which are considered fully to equal every fair expectation. The favourable character of the strata for driving, and the great water-power contiguous to the mine, are features not be overlooked, in judging of the value of the sett. The arrangements for the formation of the company for developing its resources are now complete, and a committee of management is appointed, composed of Mesers. Richard Broughton, T. Bibby, Robert Broughton, B. Williams, and W. L. Asterley. It has now taken its place in the mining share flat, 350 shares having been disposed of on Saturday last at 8L per share; and it is stated, on authority, that in one level they are now driving through solid ore, worth 10 to 12 tons per fim, with the means of leveling under to the depth of 100 yards below it, the level now cut being 230 ft. from the surface. By reference to the rules, it will be seen that the mine will be worked under the Cost-book System, and general meetings held every three months; each share to represent one vote, and every shareholder having the option of withdrawing from the undertaking on giving three months' notice.

Dalenthew Copper and Lead Mine.—This sett, which is situated in the

for 100 yards below it, the isseet now cut being 239 nr. from the surface. By reference to the rules, it will be seen that the mine will be worked under the Cost-book System, and general meetings held every three months; each share to represent one vote, and every shareholder having the option of withdrawing from the undertaking on giving three months' notice.

DALBRISHS COPPER AND LEAD MINE.—This sett, which is situated in the lordship of Builth, seven miles from Rhayader, county of Brecon, is a continuation of the Nanty-Carr Copper Mine, in which, at a depth of 55 fms., is found nearly solid ore, 3 ft. wide, yielding, upon analysis by Mesars. Johnson and Co, the Government assayists, 33½ per cent. of pure copper. By a shaft sunk to 12 fms, this lode has been traced into the Dairhiow. The latter contains, moreover, 12 additional lodes—ten of copper, and two of lead. It is proposed to drain the mine by a water-wheel of sufficient power to pump to any required depth, the same wheel being employed to work all the machinery required for crushing and dressing the ores, a great economy of time and labour being thereby ensured. The mine is divided into 3000 shares, and returns are anticipated from the main lode in three months from the completion of the machinery. The fullest confidence is apparently entertained of the richness of the sett, which comprises 500 acres, on a lease of 30 years, renewable for a similar period, and the certainty of handsome returns, in proportion to the capital expended in extending the workings.

GREAT WHEAL MICHELL, EAST WHEAL KECKWICH, AND WEST WHEAL YLTONIA CONSOLIDATED TIX AND COPPER MINES.—These mines, situate in the parish of Lanivet, near Bodmin, Cornwall, extend for one mile on the course of the lodes, and are three-fourths of a mile in breadth—being held on lease for 21 years, at 1-15th dues. They are to be worked on the Cost-book Principle. Eight lodes are said to have been discovered—the goasans of which are described as of superior quality. The lodes have been proved to the de

South Tolgus, and is quite distinct from a new mine which has taken the same name—viz., "North Buller"—and lately commenced by Mr. Pike and friends.

North Wheal Robert Copper Mine—This set adjoins East Wheal George to the west, and is situated about three miles from Tavistock, in the county of Devon. It is held on a lease for 21 years from the date of the expiration of the letter of license, in September, 1851, at 1-15th dues. A piece of ground, extending about half a mile westward, has been acquired by the present advanturers, in addition to the original extent of the sett, 300 fms. east and west, and 800 fms. north and south—a circumstance held to be of much importance in reference to the future interest of the company. The mine is to be conducted on the Cost-book Principle, and is divided into 1024 shares, on which a call of 22, per share is announced—out of which 10002 will be awarded in shares to that amount, as compensation to the present adventurers, for their past trouble and general outly on the property, to Sept-90th last, Looking at the character of the reports furnished by Messrs. Hitchins, Richards, Trevethan, and Heath, every inducement is presented for developing the resources of the mine. Between 2000k, and 3000k, appear to have been already expended in driving an adit and other necessary work, and the exact positions and bearings of the lodes, cross-courses, &c., are now being ascertamed; while the ready facilities and inexpensive means of working at command, afford the promise of a remunerative lesse to the undertaking.

OKEL TOR.—At this mine a now engine-shaft has been commenced, and is down 4 fms, from surface; the shaft is 11 ft. long, and 7 ft. wide, within the timber. The tributers are busy dressing their lead, which will be ready for market by the end of the week; another pare of tributers are working in the back of the adit, at 10s. in 17. The lods which was sunk on a short distance in

the bottom of the adit, was found to be \$\frac{3}{4}\$ ft. wide, composed of prian, lead ore, hornspar, and a beautiful white flookan by the side; the water prevented more being done here. The mine has recently been inspected by Mr. Evan Hopkins, who has sent in the following report:—

being done here. The mine has recently been impected by Mr. Evan Hopkins, who has sent in the following report:

This mineral property is aimsted to the east of Calstock village, in a narrow neck or loop of ground, in a winding of the River Tamer. The rock within the limits of the sett is composed of clay-clast, dipping south; it is intersected by the copper lodes of the district, showing very good geasan, running, more or less, east and west, and by north and south lead lodes. The most important feature in this ground is the lead lodes, and more particularly the one in which an adit has been driven 60 fathoms in extent. The rock appears highly metalliflerous, and presenting all the ordinary indications for the production of bundles of lead ore in depth. A considerable quantity of copper ore may be found near the intersection at deeper levels, but the prospects are principally confined to lead. I think, from the structure of the rock, and other geological indications, the main bunch of lead ore will be found near the output of the will be necessary to creet a powerful ongine, not less than 60-hors, near the mouth of the present adit, and sink at once to the 50 m. level. According to the present favourable appearances of the adit, a very good bunch of one will be discovered at this depth. I believe it will be necessary, in the course of time, to sink diagonally in the direction of the shoot of ore south, similar to the plans they have adopted at the Tamar Mines; however, this question may be left until the workings are sunk to the 50 m. level. The copper lodes, to the extent of their productiveness near the intersecting, will be developed the same time. The composition of the lode is exceedingly favourable for lead ore in the southern slope; there is doubtless a hard bar of unproductive ground to the north; be this as it may, I think, with a good steady management, and a system of working judiciously laid down and followed up, this may be rendered a very good mine.

COMPANY OF COPPER MINERS IN ENGLAND.—The result of the meeting of the securities on Saturday last, at Messrs. Crowder and Maynard's, has not yet transpired. It has been, however, determined to submit certain proposals to the Bank of England, which will, probably, be determined upon next week. CAMBORNE CONSOLS MINING COMPANY.—The general meeting of shareholders appointed to be held on Thursday last, was adjourned until Thursday next, the 24th inst, there being only three shareholders present, which number was not sufficient to constitute the proceedings valid.

EAST BIRGH TOR.—We understand that reports of a most gratifying character have just been received from the mine captain. The discovery consists of tim of the richest description at a very shallow depth, fully bearing out all former anticipations, and has created quite a sensation among those interested.

WHEMLARTHUM —The lode in this sett (shouts ix miles from Turn) runs.

ormer anticipations, and has created quite a sensation among those interested. WHEAL ARTHUR.—The lode in this sett (about six miles from Truro) runs parallel with East Wheal Rose lode, and is composed on the back of a very ine gossan, with rich carbonate and phosphate of lead; and in the 20 we have recently cut a rich bunch of blue lead, and have driven several fathoms in it, and is still continuing, mixed with carbonate, in a beautiful soft and congenial strata, with half a mile of soft flat ground a-bead. The 30 is driving after the 20, being about 40 fathoms behind; and the lode in that end is 3 ft. wide, being allowance.

Mr. Evan Hopkins, C.E., accompanied by St. Pierre Foley, secretary to the Mining Company of Wales, leaves London, on Monday next, on an extensive nespecting tour of the company's mines and quarries, and which will be re-

FOREIGN COPPER ORE.—The first importation from Algiers arrived at Swansea last week—180 tons having been consigned to Messrs. Bath and Son, from Philippeville; also 500 tons from Cuba; 300 tons from Arica; 100 tons from Bilboa; and a cargo this week from South Australia.

from Bilboa; and a cargo this week from South Australia.

ACOUNTICAL PHENOMENA AT BRITANNIA BRIDGE.—Some of the acoustic effects produced by this bridge are interesting. The report of a pistol fired beneath the bridge is repeated three or four times. The rapid repetition of echoes from each of the T irons, on the side of the tube gives rise to a shrill whirring musical note. When any violent noise is produced on the adjacent store, the note is the same, whether produced by the blows of the rivitters or the report of a cannon, and corresponds to a low D on a concert fute. "The cells of the top and bottom," says Mr. Edwin Clarke, in his interesting work on Tubular Bridges, "form excellent speaking tubes, and conversation may be carried on through them, even in a faint whapper. By elevating the voice, persons may converse through the entire length of the bridge, a distance of more than 500 yards. If one end of the cells be closed, they return a powerful echo, but although a whisper is thus distinctly repeated, the loudest whistle does not appear capable of returning any echo.

The Working of Zing not Injurious to Healen.—At the Paris Aca-

does not appear capable of returning any echo.

The Working of Zinc not Injurious to Health.—At the Paris Academy of Sciences, M. Sorel, replying to some authors who at preceding sessions of the eacademy had made observations tending to show that zinc was not innocuous, stated that for 15 years he had employed in his establishments for the galvanization of iron several hundred workmen, a large number of whom were occupied with pulverizing and sifting the gray or sub-oxide of zinc, for galvanic painting, and in no instance had any of the workmen of the establishment, although in the midst of on atmosphere containing much of the oxide, suffered at all from it. The white oxide of zinc had also been fabricated for some months, without any ill effects, although the men breathe considerable quantities of the oxide.

The Premen and the large of the state of the oxide.

THE PITMEN AND THE INSPECTION OF MINES ACT ,- A meeting of pitmen from various collieries on the Tyne and Wear was held on Saturday last, on the Newcastle Town-moor. About 1000 persons were present. A. Stoves, a pitman and lecturer, presided, a waggon having been provided for the accommodation of the speakers. Their names were, Wm. Thirlwell, of Seaton Delaval; R. Hodgson; W. Daniel, delegate from North Staffordshire; J. Hall, of Seaton Delaval; J. Price, delegate from Lancashire and Cheshire; James Smith, and Delaval; J. Price, delegate from Lancashire and Cheshire; James Smith, and J. Fawcett. The speakers generally expressed thankfulness for the measure which passed the Legislature last session, for a general inspection of coal mines, and resolutions were adopted pledging the meeting to petition Government to regulate the hours of labour in coal mines, hmit the period of labour to eight hours, and to provide uniform weights and measures. Thanks were voted to Mr. Wyld, M.P., Mr. Hume, M.P., and Mr. Headlam, M.P., and other friends, for their services in Parliament, and to Mr. J. Mather and the South Shields Committee for their efforts on behalf of the pitmen. Thanks were then voted to the chairman by acclamation, and the meeting broke up.—Newcastle Chronicle

## ACCIDENTS.

Wheal Mary Ann,—A miner , named Lawry, was killed, and a companion seriously in ared, by the falling of a rock in one of the levels.

Wheal Mary Asa,—A miner, named Lawry, was killed, and a companion seriously in ured, by the falling of a rock in one of the levels.

North Wales.—Three miners were destroyed, and others severely injured, by an explosion in pits near Wrexham.

Colliery Explosion of Oldham.—The inquest on the 16 unfortunate individuals who were killed by an explosion of foul air in one of the levels in the mine, caused by a fall of earth from the roof upon a safety-lamp, which broke away the gauce-work, and brought the flame in contact with the infammable gas collected in the workings, terminated in a verdict of "accidental death." On carefully perusing the evidence, it appears that no blame could be attached to any parties connected with the mine—Mr. Butterworth, the owner, being in the habit of visiting the colliery; and, according to the statement of one of the witnesses, sharing the danger with them—in fact, his own brother and nephew were at work the time the occurrence took place. At present, there is no air shaft to the mine, larger than the present one, with a view of better ventilating the workings.

Explosion at the Muirkirk Iron-Works, near Glasgow.—On Friday night, about 11 o'clock, the inhabitants of the village of Mnirkirk were alarmed by a violent explosion at the iron-works. It appears that the gas having collected in the heated pipes, during a temporary stoppage of the blast, and flowing into the main pipe and receiver, exploded; it shattered them in a thousand pieces, burst in the windows of the engine-house and dwelling-houses near at hand, and carried large pieces of iron into fields in the neighburhood. From the lateness of the hour at which the explosion occurred, happily but few of the labourers were in the works; one man was killed, and another injured, but fortunately not severely. It was supposed at first that the accident had arisen from the recent application of taking gases from the furnace by means of pipes, and conveying it to the heaters and boliers, thereby awing the cetal formerly required for he

Merthyr.—A Roberts, while working in one of ithe levels, atruck into an old workind, not thinking of 'ond air, put his candle to see what was beyond him, when the fidamp' ignited, and caused his death.

Penydarren Workz.—A serious accident occurred by the fall of a large portion of the pp in one of the levels, greatly injuring several workmen, though we are happy to learn one of them were fatally injured. Every assistance was made to rescue the unbappy sen from their perilous situation, and medical aid obtained to give relief to their sufferings.—Monspoulhshire Merkin.

ings.—Monmoulishire Merlin.

The New Bill.—An inquest was held on the body of William Jones, aged 15, who, with others, was descending the Pontop South Pit in the cage. There was a sudden check, and a light was called for, when a man climbed up the from Hutton seam, a few yards below, and it was found that Jones, having put his head out of the cage, had got jammed by the buntings, and was killed. The viewer had sent off a notice to the Secretary of State, pursuant to 13 and 14 Vict, cap. 100; and, under the rigid, unrelaxing requirements of that statute, the coroner had no option but to apprise the Home office of the inquiry, and adjourn is. The Act will have to be amended, adjournments being in most instances superfluons.—Gateshead Observer.

journ it. The Act will have to be ambraced, any of manufacture result in the flows.—Gastehed Observer.

William Walton, while recently descending the shaft of Lambley colliery, near Halt-whistle, with timber (a practice reprobated by the jury), fell out of the corf, and was killed. William Bruce, a pit-boy, was killed by the falling of a tub.

Brierly Hill—Death of a Child by falling done a Pit.—Eather Bellisson, about five years old, daughter of W. Bellison, collier, was sent with her father's breakfast to a pit in the neighbourhood of Bromley, when, not returning home, search was made, and during the same evening the lifeless body of the lillade child was found by John Brooks, down an old shaft of a pit belonging to Mr. Cox, at Bromley, and into which it is supposed the little unfortunate must have acceptentally fallen on her return.—Birmingham Journal.

Ittle unfortunate must have accidentally fallen on her return.—Birmingham Journal.

Explosion of Fire-domp.—Early on the morning of Tuesday, as the men at the Trough
Colliery, near the Nine Locks Works, Brierley-hill, were about to commence work an explosion of gas took place, by which five men, named J. Attwood, B. Shaw, J. Webb, U.
Capewell, and J. Shakspere, were more or less burnt, though not dangerously. The accident occurred through the careless of the latter person, he having very inconsiderately
taken a lighted candle into that portion of the pit (a gata road), where the gas had generated, without first using the safety-lamp.—Worcestershire Chronicle.

SMELTING IN SOUTH AUSTRALIA.—We have just received the prospectus of the Britannia Mining Company, which is now forming in South Australia. The directors comprise some of the most influential gentlemen in the colony. The mineral lands of the company are situated in the neighbourhood of the Kanmantoo and Paringa mineral sections, which have already produced some quantities of oses. The property belonging to the company consists of about 7000 acres; this is situated in the centre of the mineral district. As only the better ores have been exported to England, an accumulation of ores of a low per centage is laying at the several works. Fuel for reduction, and fluxes, if necessary, can be obtained at a cheap rate; and when it is taken into consideration the low priced ores which are smelted here, it must be a good investment for capital to smelt on the spot. The ores laying there would return a remunerative profit, though, in their present state, they cannot bear the expensive land carriage, and the heavy freight to England, added to the smelting charges here.

Club FOR ALL NATIONS.—A preliminary meeting of foreign merchants and

ing charges here.

CLUB FOR ALL NATIONS.—A preliminary meeting of foreign merchants and shippers of the port of London was held at the London Tavern, Bishopsgate-street, on Thursday, at which it was resolved that the removal of the commercial and shipping restrictions, and the great Exhibition of 1851, would naturally bring an immense number of foreign merchants to the metropolis, and it was therefore desirable, as the means of facilitating intercourse between those gentlemen, that a club of all nations should be established in London, to be provided, in addition to the usual club accommodations, with interpreters acquainted with all the languages of the East and of Europe, guides and commissioners, and departments for information. A committee of gentlemen, merchants of London, was elected to carry out the undertaking.

Monster Gasometer.—A large gasometer is being constructed at Phila-

MONSTER GASOMETER.—A large gasometer is being constructed at Phila-elphia, in a telescopic form, with two sections. The dimensions are 140 feet lameter, and 70 high, and is calculated to contain 1,000,000 cubic feet.

A number of workmen are employed in fixing a wire from the Bastille to the Madeleine, as an experiment for a new company that has proposed to establish an electric telegraph throughout Paris for the transmission of messages.

Macleine, as an experiment for a new company that has proposed to establish an electric telegraph throughout Paris for the transmission of messages. Railway Trappic.—The gross traffic for the 16 weeks which have slapsed since the 1st of July, amounts, on 5821 miles, to 4,180,0151., which shows an average of 718L 1s. 10d. per mile. The average last week was 670L 19s. 7d. per mile, indicating an advance for the United Kingdom of 47L 2s. 3d. per mile. The gross traffic for the same period of sixteen weeks last year, on 4982 miles, amounted to 3,698,154L, which was equal to an average of 722L 4s. 7d. It will thus be seen that the 839 miles of difference have created a deficiency of 4L 2s. 94d. per mile. The gross traffic for the week, amounts, on 5938 miles, to 270,324L 9s. 1d., which gives an average of 46L 10s. 11d. per mile. For the corresponding week in 1849, the traffic on 5181 miles, produced 235,780L, being equal to 45L 19s. 94d, per mile. The balance, is therefore, against this week, though only to the extent of 3s. 14d., while there have been 802 additional miles in operation.—Raineay Times.

The South-Eastern Railway Times.

The South-Eastern Railway Terminos.—A large number of workmen are now engaged in constructing this company's railway station at London-bridge, for the better accommodation of their Kentish and continental traffic. It consists of a large covered-in platform, between 700 and 800 feet in length, by between 100 and 200 in breadth. The truss principals supporting the roof are 100 feet span. There will be waiting-rooms, booking-offices, managers' and secretaries' departments; and in two menths the structure will be completed.

Whitehaven and Funness Railway.—The last section of this line, between Bootle and Broughton, is now completed, and Lord Londale and a large local party went over it on an experimental trip to Furness Abbey on the occasion.

MINES.-The amount of business actually transacted during the week does not appear more than an average, although inquiry for shares has been well maintained, especially in leading mines.

The anticipated rise in the price of copper has taken place. At a meeting of the smelters, on Thursday, an advance of \( \frac{1}{2}d. \) per 1b. was decided upon. British tin continues steady, and in moderate request; and lead

npon. British tin continues steady, and in moderate request, and reactive, at fair rates.

Devon Great Consols, Bedford United, Tremayne, Wellington, Mary Ann, Wheal Soton, South Basset, and others, continue in demand.

At East Wheal Rose the new 85-inch engine is set to work, and answers well. The mine is altogether looking better than she has for some time past: the levels extending north in the Charity ground contain good courses of lead, which augurs favourably for the adjoining sett to the north. Alfred Consols continue to improve; the lode in the 70, east of engine-shaft, is now yielding 20 tons per fm., worth from 1304. to 1404, per fm.

At Bedford United the 103 east continues very good, producing 7 tens of ore per fathom.

At Bedford United the 103 east continues very good, producing 7 tens of ore per fathom.

Crebor Consols is looking very promising. On the 25th, 23 tons 9 cwts. will be sampled, being the quantity raised for July and August.

The Pentire Glaze and Pentire (united) are reported as being in an improving state. Thirty tons of lead ore will be sampled on Monday; and, from present prospects, they expect to raise 15 tons a month, with every probability of an increase from the ore ground they are opening.

Drake Walls is looking well generally, and in several points prospects of early improvement are manifest. At the proposed new sett of West Russell, to the cast of Drake Walls, some excellent stones of lead have been taken from the cross-course, and also some fine stones of copper from the lode.

Lewis Mines are reported to have improved since the last official account.

from the lode.

Lewis Mines are reported to have improved since the last official account.

Tincroft looks remarkably well throughout. On Wednesday 628 tons of copper ore were sampled, being an increase of 72 tons over the former sampling; and 32 tons of tin were sold at 42l. per ton, the whole being one

sampling; and 32 tons of tin were sold at 42th per ton, the whole being one month's produce.

From the Tamar Consols 64 tons of silver-lead ores were sold, on the 15th, to the Tamar Smelting Company, at 16th 8s. 6d. per ton.

Wheal Franco September ores are computed at 96 tons.

Three parcels of silver-lead ore from Court Grange Mines realised—23 tons, 16th 7s. 6d. per ton; 20 tons, 14th 12s.; and 2 tons, 12th 12s. per ton.

Wheal Golden has sold 36 tons of silver-lead ore at 13th 1s. 6d. per ton, realising 470th 14s. The highest bid for about 100 tons of Laxey lead ore was 19s. 5s. per ton.

The Levant accounts for July and August show—Balance from last ac-

realising 470l. 14s. The highest bid for about 100 tons of Laxey lead ore was 19s. 5s. per ton.

The Levant accounts for July and August show—Balance from last account, 793l. 0s. 3d.; sale of tin, 299sl. 11s. 3d.; copper ore, 266sl. 10s. 3d.; sundry receipts, 2l. 18s. 2d.—6460l. 19s. 11d.—Mine cost, 322sl. 19s. 5d.; materials, merchants' bills, &c., 1635l. 7s. 3d.; by dividend of 5l. per share, 800l.—leaving balance to next account, 796l. 13s. 3d.

At Wheal Seton two-monthly account, there appeared to be a profit of 77cl. 7s. 2d. for the months of July and Aug., which allowed a dividend of 5l. per share, amounting to 990l.: leaving a balance to next account of 93l. 15s. 2d. The mine is looking well, and an increase may be expected at next audit meeting.

At the Fowey Consols meeting, held at the mine, on Tuesday, the accounts for May, June, July, and August, were presented, showing—Balance end of April, 6997l. 6s. 2d.; ores sold, 13,281l. 15s. 11d.; sundries, 77l. 3s. 2d. = 20,356l. 5s. 3d.—Costs and merchants' bil'e, 12,216l. 10s. 8d.

—By dividend of 1l. 10s. per share, 74ll.: leaving balance in favour of adventurers of 739sl. 14s. 7d.

The Stray Park, Camborne Vean, and Wheal Francis Mines accounts showed a profit of 395l. 7s. 5d. for the two months, which, added to balance on last account, allowed a dividend of 10s. per share, carrying to credit of next account, 381l. 11s. 3d. The agent's report states the mines generally to be in a productive position.

At the half-yearly meeting of the Union Tin Smelting Company, a

next account, 3811. 11s. 3d. The agent's report states the mines generally to be in a productive position.

At the half-yearly meeting of the Union Tin Smelting Company, a dividend of 10 per cent. on the paid-up capital was declared.

At Caradon Vale two-monthly meeting, the accounts showed a balance of 59l. 4s. 3d. against the mine, when a call of 7s. 6d per share was made, in instalments of 5s. and 2s. 6d. for the 29th of the present month and the 30th November. The report given elsewhere states that the engineshaft is in course of sinking to the next lift, which is to be 14 fms. under the 14 fm. level. The shaft is in very superior killas, and ore is expected at a shallow depth.

At North Buller quarterly meeting, a balance of 185l. 12s. 4d. was declared in favour of the mine; but to carry out operations still more effectually, a call of 1l. per share was deemed necessary. A new 36-inch steam-engine has been ordered, and the underground operations are being prosecuted with spirit, the prospects generally being considered as highly encouraging.

prosecuted with spirit, the prospects generally being considered as highly encouraging.

At the Kirkcudbright monthly meeting, the accounts showed a balance of 200l, in favour of the company. The prospects of the mine are much improved, and there is every probability of the returns being increased, whilst the expenses will be lessened.

Camborne Consols meeting, called for an especial purpose on Thursday, was adjourned to that day week, owing to there not being a sufficient number of shareholders present to constitute a legal meeting, according to the Dead of Settleman.

Deed of Settlemer

ber of shareholders present to constitute a legal meeting, according to the Deed of Settlement.

At East Pool two-monthly account, the balance-sheet showed 7374. Is. against the mine. This amount will be considerably lessened by the receipt of a large sum in the shape of a dividend from the estate of Mr. P. V. Robinson. The agent's report is favourable, and it appears that they are approximating a highly important point—viz., the North Tincroft lode, by a cross-cut in the 70.

At Wheal Blencowe meeting, the account for the quarter ending July showed a balance of 651. 12s. 11d. due to the purser, and a call of 7s. per share was made. The agent states that he has not yet succeeded in reaching the east and west lodes, as he had anticipated at the last meeting. The tin previously sold appears to have been raised from the old south lode.

At the Wheal Prudence meeting, the accounts were' presented, showing—Mine cost for nine months, ending September, 1851. 12s. 8d.—By call, 1281—leaving balance due to purser, 571. 12s. 8d. A call of 10s. per share was made. Since the last meeting a large lode has been discovered at surface, and which they expect to cut in driving about 10 fms. further.

A meeting of shareholders in the West Phoenix Mine was held on Monday, when an efficient committee of management was formed. The share-list, which is nearly completed, will be closed in a few days.

Shares in the following mines have changed hands since our last—viz.: Devon Great Consols, South Tolgus, Tremayne, Bedford United, Alfred Consols, Wellington, Mary Ann, Trelawny, Daren, Tregorden, Great Sheba Censols, Wellington, Mary Ann, Trelawny, Daren, Tregorden, Great Sheba Censols, Wellington, Mary Ann, Trelawny, Daren, Tregorden, Great Sheba Censols, Wellington, Mary Ann, Trelawny, Daren, Tregorden, Great Sheba Censols, Wellington, Mary Ann, Trelawny, Daren, Tregorden, Great Sheba Censols, Wellington, Mary Ann, Trelawny, Daren, Tregorden, Great Sheba Censols, Wellington, Mary Ann, Mary Tavy, and Wheal Langford.

In Foreign Mines, c

Rey, Copiapo, Cobre, Santiaga, Linares, and United Mexican. Great fluctuations of price have taken place in the last-named shares.

The Linares report to the 5th Oct, has been received, representing the operations as progressing in the most encouraging manner. One hundred tons of lead ore were raised in September, and about the same quantity may be expected for the current month. The amount of ore weighed in during the week is given at 27 tons 15 cwts, whilst the total quantity at Linares, and the two shipping ports of Seville and Malaga, appears to be 358 tons 10 cwts.

Letters have been received from the Worthing Mines to the 22d June. The report states that Hodgkinson's winze had been set at 10s. in 1l. Nothing further of importance has been advised.

The Australian Mining Company have received advices to the 7th June. Ansiey's engine-shaft has been set to sink at 50l, per fin. The prospects are said to be most favourable, and only time and capital are required to bring the mines into a profitable position.

The imports of ores and metals at the port of London for the week ending Oct. 10, were—150 tons of copper ore, and 3892 bags ditto, from Port Adelaide; 1167 ditto from Sydney; 591 cases of copper, 2638 ingots, 1789 tiles, and 210 slabs, from Port Adelaide; 990 slabs from Punta Arenas, Central America; 6 cwts. old copper from Demarra; 37 ditto from Sydney; 1773 pigs of lead from Cartagens, Spain; 4757 plates of zinc from Stettin, Prussia; 959 ditto from Hamburg; 101 casks, 169 cases, and 63 casks of nalls, from Antwerp;

800 kegs of steel, 7321 bars of iron, 8 bundles, and 220 bags, from Gottenburg 3800 slabs of tin from Hernosand, Sweden; 2588 ditto from Stettin, Sweden; 2500 slabs of tin from Bombay; 1 box of silver, and 1 ditto of gold, from Cape Palmas, Guines.

360 slabs of tin from Bombay; 1 box of silver, and 1 ditto of gold, from Cape Palmas, Guines.

The imports of ores and metals at the Port of Liverpool, in the week anding Oct. 15. were—88 bags of silver ore, and 107 ditto of cobalt ore, from Valparaiso; 968 tons of copper ore from Port Adelaide; 180 ditto, and 52 bars, from Callao; 2661 ditto from Valparaiso; 141 ingots, 166 tiles, 553 cwts. of lead ore, and 2102 bags, from Port Adelaide; 79 slabs of tin from Valparaiso; 696 ditto from Singapore.

The imports last week of foreign copper ore at Swansea were moderate, only amounting to 1930 tons, of which 180 tons came from the new copper mines of Algeria. On Monday, the 14th inst., the Jane arrived with a cargo of rich copper ore from Port Adelaide.

It appears by accounts recently come to hand from South Australia, that the exports of that colony amounted to 232,870. in the first quarter of this year, being an increase of 79,518 compared with the same period last year, when they only amounted to 153,3577. The great increase has been in copper, no less than 30,617. worth, or about 400 tons having been exported in that period, while in the same time last year there were only 700. worth, or about 10 tons. The exports of copper ore have increased from 57,8611. to 22,215.

HILL, Thusspax.—Messrs. T. W. Fiint and Co. state, that mining shares wear an im-

HULL, TRUESDAY.—Measure. T. W. Flint and Co. state, that mining shares wear an improving appearance. Business could be done here in Trelawny, Trelane, Wellington, Kirkendbright, Treleigh Consols, Mary Ann, and other stocks, at current rates. They have had a remarkably firm market for railway shares throughout the week. The buying has been of a good kind, and to some extent.

In another page will be found a document of great value to the mining interest—the annual return, with which we are favoured by Mr. Robert Hunt, of the Museum of Economic Geology, showing the produce of lead and lead ore in the various districts of the country, during the year 1849. We received the paper too late to devote that attention to which its importance merits—but the statistics are so ample, and prepared with so much accuracy, that we are sure it will be perused with considerable interest. We may also direct notice to the article on the Cardiganshire mining district, as containing much information.

Cold-blast, free on board in Wales.

REMARKS.—The bar-iron market continues without alteration—the principal makers remain firm at 4. 12s. 6d., while a limited demand exists at 4t. 10s. free on board in Wales, at which sales of ordinary make are being effected. Most of the business, however, is in rails, for which considerable orders continue to arrive. Scotch ple-iron has recorded 6d. per ton during the week, but owing to more lively appearances, prices have been recovered, and the market is firm at a elight improvement on last week's prices. Swedish iron is being sold at 11t. 10s. to 11t. 12s. 6d. Swedish steel in kegs has improved 15s, per ton. The stock has been bought up on speculation, and asies are being effected at 4d. 10s, per ton. Spelter has been without a transaction to note, and the market is flat at 16t. 15s. Copper is at length fixed at an advance of id. per lb., at which orders may now be freely executed. British tin continues steady, and in moderate request. East India tin—Banca has again improved 1t. per ton. Sales are reported at 8tl. Straits firm at 79t. Lead is in active request at fair prices. Tin-plates continue unaltered.

LIVERPOOL, Oct. 18.—On Wednesday, the long-looked-for advance on copper and metal of id. per lb. was declared, and on unmanufactured descriptions 4L les, per ton, at which rates we experience a steady demand. A large parcel of Chili copper, of unwards of 200 tons, 50 per cent., has been purchased during the week at 76. per ton, ex ship, leaving our market bare of the article. The Pakenham, from Adelaide, recently arrived, brings about 700 tons of Burra Burra ore, we understand, on account of a London firm, and which has found eager buyers on terms we did not learn. This is the first direct import for a considerable period, chiefly in consequence of the nominal reights accepted by the London wool ships, who take it as ballast. The splendid line of packet ships recently laid on for that quarter, will, very probably, bring portions of their cargo of this mineral, for which a ready said can at all times be had at the prices current at Swanses. Iron continues firm without alteration in price; and we do not now look for amendment until the turn of the year.

Advices from New York, under date the 1st inst., report some private sales of Ameri an lead as having been made at \$4 62\frac{1}{2}\$ c. cash.

At Philadelphia copper met with limited sales:—Sheathing at 21 c., and yellow metal at 17 c. per lb., six months. In iron, the prices were firm for pig metal, and the receipts small: sales were reported of No. 1, in lots, at \$21, and No. 2, at \$19 per ton. Some Scotch pig had been sold at \$20 00 c., six months. In bar and boiler iron there was no change. For lead, the market was firmer, with sales of 2000 pigs galena, to arrive, at \$4 70 c., cash, and 300 pigs, at \$4 80 c., cash.

Hamburg accounts recent that execution is a second of the sales of 2000 pigs galena, to arrive, at

Hamburg accounts represent zine as continuing to advance in price, the current rat being 10 2 to 10 4. In other metals nothing doing.

Liverpool, for the first nin

SOUTH CARN BREA.—We are informed that Messrs. Smith and Roberts, of Truro, the legal agents of Lady Basset, the owner of this land, have posted notices on, and in the neighbourhood of, this mine, forbidding all persons from mining therein. This course, we presume, has been taken on the presumption that no mine lease has been granted of the land; but it is said that Mr. Lyle has the lease in his possession, although the counterpart, which ought to be at Tehidy, is not to be found. This measure on the part of the solicitors will, therefore, go for nil, for we understand that no forfeiture has been incurred.

Tehidy, is not to be found. This measure on the part of the solicitors will, therefore, go for sil, for we understand that no forfeiture has been incurred.

Mining in France.—According to a late report, more than 500 metallurgique mines, besides those of iron, have been discovered. This number includes 17 gold mines, and 214 of ailver, 5 of mercury, 88 of copper, 6 of pewter or tin, 60 of lead, 14 of ainc, and 36 of manganese. Ten only are worked in a regular manner, and only four are returned as producing more than 160,000 fr. annually: these are the silver and lead mines of Pontgibuad, of Poullaouen, and of Vialas, and the manganese mine of Romaneche. The produce of all the mines, exclusive of those of iron, does not exceed 1,400,000 fr. Copper manufactories employ the dregs of old works: this second-hand industry has but few establishments in France, where, however, it could be developed on as great a scale as in England. The principal branch of metallurgic work in France is that of iron. The progress of this branch of industry since the return of peace is remarkable. In 1808, according to M. Heron de Villefoses, the total production of Europe and America did not reach 740,000 tons, while in 1847, according to M. Michel Chevalier, England alone produced more than 1,500,000 tons, and Russia, Sweden, and Prussia united about the same as France. The employment of combustible mineral has been the cause of this great progress.

DEPUTATION TO MR. CHAWSHAY.—On Monday last several of the colliers waited on Mr. Crawshay, as a deputation from some of the coal levels, to ask him to advance the price, as many were in a state of destinction with their present earnings. They were received kindly, and promised that their cause should be taken into consideration.—Monmothshire Merlin.

Merbyr.—A poor old miner, aged 65, was severely burnt on Monday, by the fire-damp in Mr. Wayn's coal-pit. His injuries were so severe that he is not expected to recover. Rest. Cossois, Tweedonache.—As John Toon was engaged in repairing an old

## CORNISH STEAM-ENGINES.

The number of pumping-engines reported for the month of Sept. is 25—the quantity of coals consumed being 1860 tons, lifting, in the aggregate, 17,000,000 tons of water 10 fathoms high—the average duty of the whole is, therefore, 51,000,000 lbs. lifted 1 foot high

"A Manchester Reader."—The prize of English pig lead at present varies from 161, 15s.

"A Manchester Reader."—The prize of English pig lead at present varies from 161, 15s.

to 171, 10s. per ton, that of Spanish in bond at about 162. The cres of lead are valued according to the agent of Spanish in bond at about 162. The cres of lead are valued according to the sales of lead ores reported in our columns, it will be seen that various prices are given for ores which are all the produce of the same union. This arises, in many cases, from the botter quality of the ores, in others from superior dressing, and the labour employed in raising the inferior sorts to a highest per canage. Where this does not pay the cost of labour, the ore is but slightly dressed, and sent to market as an inferior kind.

The communication of Mr. A. Savage, on the Exhibition of Works of all Nations, having been inserted in several of our contemporaries, cannot appear in our Journal.

D."—The Electric Telegraph Company have no power to prevent any person from putting up wires, &c., or working instruments, providing they do not in any way infringe upon their patents.

upon their patents.

The letter of "An Enemy to Humbug" (Truro), without effecting any good—" the mischief being done"—would compel as to devote much space for a reply.

"B."—Dr. Murray, in his "Memoirs on the Diamond," states that the diamond mines of the Brazils were discovered about the middle of the last century. Many curious bright stones were discovered by some miners when in search of gold. They were used as counters for eards, and some being sent to Lisbon, their real value was soon discovered and determined.

W. G." (Manchester).—We have no doubt our correspondent would meet with an engagement by advertising—the charge for which would be 5s.

\*W. G.\* (Manchester).—We have no doubt our correspondent would meet with an engagement by advertising—the charge for which would be 5a.

\*A Shareholder" (Strand).—In the report of the Tamar Silver-Lead Mining Company, read at the meeting, held on the 7th instant, it states that the chimney is 600 feet long, not "high," as our correspondent has arroneously read; this seems overdrawn to those who have not been on these works, or those of a smilar description; many of the stacks in the smelting works in Wales are much longer. A rough sketch was on the table, showing the plan of the engine, and rendering it perfectly comprehensible, though we willingly believe those not thoroughly conversant with mining operations may not fully understand the report. The manager is a gentleman of acknowledged talent, and we believe uses his utmost exertions to advance the interests of the properties he is connected with. Want of capital has decidedly cramped the concern, and we believe, judging from the reports, that both mines and smelting works will ultimately prove advantageous to the shareholders. Had our correspondent attended the meeting, we have no doubt every explanation would have been afforded to him, and expressions which, from their technicalities, appear mystifications and unintelligible, would have been perfectly clear and satisfactory. We endeavour to give faithful reports of all meetings, but it would be perfectly useless to give, is exicase, all the desultory conversation which cause consequent on queries and answers.

\*A Subscriber" (Leek).—We should be glad to receive the particulars; we are at all times thankful for local intelligence.

3dit, up to the year 1823, was burthened with a duty of 15s. per bushel, and the gross

times thankful for local intelligence.

Salt, up to the year 1823, was burthened with a duty of 15s. per bushel, and the gros quasitiy consumed in England was 295,000 tons. In 1825, with a duty reduced to 2s. the consumption became 342,000 tons. Since that period the article has been free, and the export price is now about 3s. per cwt.; while the quantity produced merely to sattisfy the foreign demand has nearly reached 10,000,000 bushels for the seven completed months of 1850.

months of 1890.

"A Miner" (St. Austle).—We must decline to recommend any particular course, as "the best," for our correspondent to adopt, to "dispose of some abares in one of the best copper mines in the world." "A Miner" had better apply to some broker (the addresses of several appear in our advertising columns), who will advise him. Something more than his word, and a few strangely vague reports, will be required, to satisfy parties of the value of the sett, pravious to embarking their capital.

"G. F. M." (York).—Alson Moor, in Cumberland, is the only known locality of baryto calcite. In the lead mines there it is met with in considerable quantity, and occasionally in crystals, which exceed an unit is length; but the large crystals often suffer decomposition, and are converted into a whits mealy-like mass, resembling barytes. It was first described by Brooke; it is either transparent or translucent, with a vireous or resinous lustre and white streak. Before the blow-pipe, by itself it does not fuse; but with borax in the oxidating flame affords a disphanous globule of a light améthysite tinge, which becomes colouriess in the reducing diame. It effervesces briskly in nitrite or muriatic acidd.

## THE MINING JOURNAL

Railway and Commercial Sagette.

LONDON, OCTOBER 19, 1850.

The Minimo Jouanal is published at about Eleven o'clock on Saturday morning, at the office, 26, Fleet-street, and can be obtained, before Twelve, of all news agents, at the Royal Exchange, and other parts of London.

The Missian Journal is published at about Eleven o'clock en Saturday morning, at the office, 26, Fleet-street, and can be ebtained, before Tweive, of all news agents, at the Royal Exchange, and other parts of London.

The quarterly meetings of the ironmasters terminated at Dudley, on Saturday last: as might have been anticipated, they were merely a confirmation of the previous meetings at Wolverhampton and Birmingham. The proposition of the Welah ironmasters to reduce the make was received with cordial approbation, and it was considered a matter of necessity that production should be diminished for the next quarter. On the 14th, one of the most respectable firms of South Staffordshire (Messrs. Thornswarcarr) issued a circular, announcing a reduction in price of 10s. per ton, and 10s. per ton further allowed as commission on bars, hoops, and sheets. When a large firm such as this takes the initiative in the reduction of price, and which has been supplying an almost exclusive article, thereby obtaining a species of monopoly in the trade, we must confess that we fear it will be some period before the iron interest returns to that healthy and sound state which is so conductive to the well-being and prosperity of any branch of industry, and more especially to that which may be considered as one of the great staple articles of commerce, and sources of national wealth. On referring to statistical accounts, we find that the make of malleable iron in 1845 was calculated at 35,000 tons, and the average price for the year was 94.5s. per ton, while in 1849 the production had increased to 80,000 tons, at an average price of 54. 17s. 6d., the price of pig iron averaging in 1845 4d. Os. 3d. per ton, and in 1849 2d. 6s. 1d. We have no doubt the prices given in 1845 and 1846, during the excitement attendant on the railroad mania, were highly remunerative, and probably led many to erect works, in the delusive hope that the demand would be permanent. If however, iron, as we were informed, in those days was made as cheap as possib

think, if this resolution had been come to at an earlier period, when the workmen had hopes of obtaining other employment, that it would have been much better, both for masters and men. As it is, we trust the depression will not be for a long period, and that the coming year, to which so many look forward with glad and buoyant hopes, will shed the beam of its kindly influence over the ferruginous produce of Great Britain.

Our attention has been directed to the general feeling of disappointment which is felt throughout the district traversed by the South Wales Ramway, at the high "scale of tonnage rates," and the unequal way in which they are imposed. This is apparent on an inspection of the following tariff for first-class goods, such as coal, culm, iron, &c. :-

It will be observed that considerable ingenuity has been displayed in the construction of this tariff, so as to exclude the probable traffic from the line, and to favour that which has no existence. There is a considerable and constant traffic, both by the turnpike-road and the canal, between Swansea and Neath, and this would have been considerably increased had the railway terms been more reasonable. It is well known that the demand for bituminous coals is frequently greater than the supply in Swansea, and it was anticipated that this inconvenience would be remedied on the opening of the railway, by enabling parties to send coal to Swansea, who are at present shut out of that market. The charge from Neath to Swansea on the railway is thirteen pence per ton per mile, whilst it can be conveyed on the turnpike-road for ten pence per ton per mile! The principal goods traffic on the line is between Newport and Cardiff on the east, and Port Talbot, Neath, and Swansea on the west end; yet the directors have virtually rejected it, by issuing this prohibitory tariff. It must be observed, that the charges quoted above are on the lowest scale, and that general merchandise is charged one-third more than such goods can be carried for on the turnpike-road. It may be said, that under what is called "mileage rates," such articles as coal and iron may be conveyed on much more moderate terms—namely: "one mile to fifty miles, at 14d. per ton—which is certainly an approximation to a business-like demand; but, unfortunately, this redeeming trait is clogged with so many conditions as to present but little inducement for its acceptance. For instance, no goods at the mileage rate are to be charged less than its 9d. per ton—that is, for six miles at the rate of 3-50d. per ton per mile, and for eight miles 2-62d. per ton per mile. This "does not include any charge for loading or unloading, which is the duty of the persons who send the goods." And "in no case of goods carried at a mileage rate, will the company be responsible for any ri

the distance of those which are near, carrying the principles of "equality and fraternity" into effect in such a way as to be exceedingly ingenious and amusing, but savouring somewhat more of imagined results, than plain common sense can either sanction or tolerate. If it be merely an experiment, it is a most unhappy one, both in design and execution, and will do much to raise prejudices against public railways in the principality.

when the Elbe Copper Works were commenced, about three years since, we predicted that, in a very short period from their establishment, similar works would be erected in South Australia. Our predictions have been more than verified. From the last journals which have arrived from that flourishing colony, it appears that "tough cake copper is offered for sale at the offices of the South Australian Company." The Calder brig sails for Singapore with a cargo of 246 ions of copper, valued at upwards of 20,000l. sterling—this cargo consisting of 5257 cakes, 152 blocks, 4369 ingots, 76 pigs, and 3900 tiles. This copper is from the Kooringa, Aporinga, Yatala, and Kanmantoo Works; and, according to the assays made in Calcutta, is reckoned to be the purest ever brought to that market, and equal to the Russian ingot. A talented correspondent (Mr. J. H. Muzeniuson) has given a table of the value of ores exported from South Australia. From this it appears that, in the year 1841, 1811, minerals to the amount of 390l. were exported; in the year 1843, 20 tons, value, 1291.; 1844, 442 tons, value, 64371; 1845, 1158 tons, value, 19,0191.; 1846, 6699 tons, value, 142,2311.; 1847, 9301 tons, value, 174,0171.; 1848, 17,0061. value, 220,6241.—making a total of 34,536 tons, and a value of 662,4561. This immense production has hitherto been brought to our market; and our smelters have had the benefit of the profits. English coal and labour has been employed in its reduction; and it has been sold in the market as British copper. On looking at the South Australian mines as an entirety, they must be considered as fortunate adventures. The country is almost virgin ground; yet, at this early period, it dares to compete, and that successfully, with the parent country in the Indian market. We are no alarmists; but we think that had our mining interest a small portion of the energy of their Australian rivals, they would not so long have been under the thrail of the smelter. At various times, attempts have been under the training the Indian mar

works, an to blame surprised, as it has heads, we detriment

works, and others are likely to follow. The mining interest have no one to blame but themselves for their culpable apathy; and we shall not be surprised, should the colony of South Australia progress proportionately, as it has hitherto done, that before the next decennium passes over our heads, we shall see them importing copper into "Great Britain," to the letriment of our own mining community.

heads, we shall see them importing copper into "Great Britain," to the detriment of our own mining community.

On the 10th August last, the Royal Assent was given to an Act for the better "Inspection of Mines and Collieries." This, though not complete in its details, was a step in the right direction, and we hailed it as a measure which probably would prevent that fearful waste of life which it has been our melancholy duty to record. On referring to our accounts, it appears that in the present year, up to the 30th September, the number of accidents have been 319; the total amount of deaths 423; 179 have been caused by explosions, 113 from falls of roofs, 61 from falling down shaft, 8; machinery 16; explosions, 60; falls of roof, 23; falling down shaft, 8; machinery 16; explosions, 60; falls of roof, 23; falling down shaft, 8; machinery 16; explosions, 60; falls of roof, 23; falling down shaft, 8; machinery 16; explosions, 60; falls of roof, 22; falling down shaft, 8; machinery 16; explosions, 60; falls of roof, 22; falling down shaft, 8; machinery 16; explosions, 60; falls of roof, 22; falling down shaft, 8; machinery 16; explosions, 60; falls of roof, 22; falling down shaft, 8; machinery 16; explosions, 60; fall of roof, 22; falling down shaft, 8; machinery 16; explosions, 60; fall of roof, 12; fall in shaft, and 1 by accident; while the injuries have been 3-1 by accident, 2 by explosions. On a recent dreadful loss of life at the Airdric Colliery, it was stated that the loss of life there was to be attributed to the non-usage of the safety-lamp, which was stated to be universally in use in England; unfortunately, our miners are equally as carcless as their northern brethren. If the reader will refer to our account of accidents in the present mouth, he will find that several lives have been sacrificed in the morth, and in Wales, owing to the workmen from canadities which might occur from either the avariee or ignorance of their only of the proper and limited inspection, so as to secure the workmen from canaditi

One most important duty of any governing body is, so to profit by the warning afforded by any untoward occurrence, as to prevent the repetition of the evil; or, if that be impossible, to take such steps as shall tend to mitigate its injurious effects. With this impression on our minds, we wish to call the attention of the "powers that be" to a few observations that suggest themselves from the consideration of the late strike on the Eastran Countries Railway. We are not going to wade through the whole of the proceedings, which must be fresh in the remembrance of our readers; we will merely glance at the main points of the transaction. Certain disagreements having occurred between the engine-drivers and firemen on the Eastern Counties Railway and their superintendent, the engine-drivers (by a deputation) waited upon one of the directors, with an announcement that unless the obnoxious superintendent be immediately removed they should at once resign. And, notwithstanding, the director to whom they applied requested them to wait until the board met, and took their case into consideration, within an hour the resignation of every engine-driver and fireman on the line was handed to the superintendent, with a notice that they should leave work in a week. Now, though the directors upon the receipt of this intelligence determined not to succumb, and eventually succeeded in overcoming the difficulties attempted to be thrown in their way, yet it was not without immense exertion, and probably at a loss, other directly or indirectly, of several thousand pounds. Even then they were compelled to suspend a number of trains per diem, though only for a week, yet seriously to the inconvenience of the public, and likewise to the manifest unessiness of those who were compelled to travel by the line, from the very natural fear that the whole line being in the hands of strange drivers, some serious accident would be very likely to occur, though the directors adopted every precaution which laid in their power to obviate such a mischance

quires a knowledge of the road on which he arrives, is not have to be parted with, except upon serious grounds. Now, as there is but a limited demand for this species of lubour, and when once supplied it is rarely changed, it follows that there is small chance for surplus labour in this branch of industry; and, taking into account also the immense danger of putting inexperienced hands into such difficult positions, and the length of time required for a man to efficiently fulfil the duties required, we cannot halp heing alarmed as what may perchance be the consequences should putting inexperienced hands into such difficult positions, and the length of time required for a man to efficiently fulfil the duties required, we cannot help being alarmed at what may perchance be the consequences should a strict union be formed amongst this class of mechanics. In the late strike it was very evident that the contest was most severe, and for some time the event hung trembling in the balance, it being very doubtful which party would succeed. Fortunately, the cause of order triumphed, and we are for a time safe; but may we not fear that, warned by their past failure, the engine-drivers will combine more strenuously, and exert themselves to the utmost, to obtain proselytes to an object that holds out to such men the almost irresistible attraction of power? On the other hand, let us also be warned by the danger we have already incurred, to take such steps as may proceive us from a similar, or even, perhaps, more serious contest. We know well the difficulty that must ever attend the interference of the Legislature with the rights of labour, but we do think this a case of sufficient magnitude and importance to justify such interposition. We hold it to be equally disastrous—nay, more so—for a num-

ber of engine-drivers to send in their resignation simultaneously, as for several members of the yeomaury cavalry to do so; yet, in the latter case it is mutiny, while in the former case it is unpunishable. Of course it would require much thought and grave deliberation to legislate on so difficult a point, still we think it high time that the subject was taken in hand by the proper authorities: meanwhile we think it is in the power of the various boards of directors to do much to baffle such atrocious attempts at despotism. In all cases of strike the maintenance of the evil depends in a great measure—nay, entirely—upon the means the unionists may possess of supporting their brethren while the subject matter of dispute remains unadjusted, and upon the cessation of those means the parties who have voluntarily cast themselves out of employ must return to their allegience, or seek employment elsewhere. It is obvious that the directors might cause every man, upon entering their employ, to sign, with a copy of the rules and regulations, an agreement, obliging them to give six months notice of leave at the option of the directors, under a penalty recoverable inthe County Court; and those who are already in the employ of the various boards should also sign similar agreements; while, to obviate the possibility of a simultaneous movement, they might be renewable every six months, and be divided into, say, 12 divisions, one division for each month. We are quite aware that there may be some objections to this course, and some difficulties to contend with, but none of him of anything like the magnitude of the vills attendant upon a strike. In the event of such a movement, the recovery of the penalties would inevitably and speedily absorb the funds of the union, and bring the refractory members to their senses. It would undoubtedly cause considerable additional trouble, but until some bester method can be devised, we considerable additional trouble, but until some bester method can be devised, we considerable additional trou

The meselves and their servants.

Prace A correspondent.]

After the long period of depression which had weighed down the mining enterprise of Cornwall and Devon, the tendency to legitimate speculation, which appeared early in the present year, was hailed with feelings of satisfaction by all prisons directly and indirectly connected with the mineral districts; and it was hoped that legitimate adventure would meet with that encouragement and support which it so well deserves. No sooner, however, did the dawn of better times appear above the horizon, than a number of reckless and unprincipled "bal" sellers were again in the field; and the names of mines could be given which have been lately started in different parts of the country, in which the number of shares vary from a 1000 or more, quoted at 10s. or 20s. per share, when not 20l. has been expended on the concern, and where the shafts are not sunk more than a few fathoms from the surface. Some prilly stones of ore are obtained from the mine, and reports are sent to London, stating that the lode is kindly, &c. If this practice is carried on without some check, it will do more to retard real mining enterprise than any other cause which may affect it; and some caution should be given to the London speculator, that he might avoid these harpies, whose sole aim is not to benefit the community, but enrich themselves, and who, by their unprincipled schemes, have thrown great discredit on the county, and rendered the name of Cornishmen distasteful, to say the least, to the metropolitan adventurer. Several new mines are about to be put in operation, and some of the old ones are about to be resumed; but unless great circumspection is exercised, a number of worthless ones will be brought into the market; and we shall probably see the schemes of 1835 revived, to give an apparent show of prosperity, to be followed by years of gloom, adversity, and inactivity.—[In inserting our correspondent's remarks, we by no means anticipate the consequences which he apprehends. The chan

## THE GREAT EXHIBITION-PATENT LAW REFORM.

The Great Exhibition of 1851, amongst the other advantages it promises to society, appears likely to confer a very great benefit on it, by the attention which it has directed to the mal-administration of the laws which profess to encourage inventors and inventions—viz., the Patent Laws, which, our readers must be well aware, do not carry out their professed objects, but rather tend to repress inventions and oppress inventors.

which, our readers must be well aware, do not carry out their professed which, our readers must be well aware, do not carry out their professed objects, but rather tend to repress inventions and oppress inventors. The pages of this Journal have, for some years past, been occupied from time to time by the complaints of inventors, the suggestions of patent reformers, and our own advocacy of the good cause; and, for a long time, we have been all but the sole advocates of amendment, surrounded by apathetic indifference; but at last the embers which we have been endeavouring to fan into a flame have begun to blaze forth, and presage the refinement and purification of the present noxious system; for, to speak plainly, we rejoice to find most of our contemporaries are investigating the abuses of the present law, and advocating the adoption of an efficient remedy.

As regards the Great Exhibition, it is quite certain that it cannot be expected to be anything of an exposition of the full extent of the inventive genius of this country, as the commissioners can offer no protection to inventors of the great improvements, but only to designers of new shapes quaranteed protection to the former, having been cut down by the Committee of the Commons to the meagre proportions of a new Designs' Act. Under these circumstances, it cannot be supposed that those persons who are not able to patent their inventions (amongst whom are large numbers of our most ingenious inventors) will be ready to expose them to the chance of piracy, and the loss of their right to a patent, by exhibiting them in 1851, although they are invited to do so by the worthy\*consort of her most gracious Majesty, and are offered a place in the Great Palace of Glass, with the prospect of a medal of gold as their reward. In fact, it is a commonly expressed determination on the part of inventors to withhold their productions from the Great Exhibition, unless they are assured to preside, for the purpose of procuring without delay such an amendment of the law as shall

We understand that our correspondent, Mr. Campin, the patents agent, who has, during the last three years, put forward so many important suggestions for the amendment of the law, has given much assistance to the League; and we trust that some practical good will result.

To the queen's most charged margin a present the law the results and the understand margins.

The humble petition of the undersigned persons, &c.

The humble petition of the undersigned persons, &c.

Shaweth.—That the arrangements made for holding an Exhibition of the Industry of all Nations have especially directed the attention of your petitioners to the serious disadvantages under which British inventors labour, in consequence of the trouble, expense, and delay which must be incurred, in order to obtain and secure the patent rights for any new invention. Thus, whilst the inventor in most other countries can have his rights acknowledged, and secured to him for the small sum of 10%, the expense of obtaining patents for England, Scotland, and Ireland amounts, including stamps, &c., on specifications and drawing: (often very costly), to seldom less than 400%. The practical effect of this being to deny the inventor his title to the possession of the property in his own invention, unless possessing sufficient eaplial to pay these enormous charges.

That the present system affords facilities for frandicin opposition, to the great damage of inventors the want of a classified index and cheap publicity, the records of patents of inventions are practically shut up from the inventigation of inventors and manufacturers and that, consequently, the expense of obtaining leiters patent is frequently incurred more than once for the same object.

That the large expense incurred in procuring your Royal Letters Patent is often no security to new and valuable inventions, in consequence of the unapt and expensive legal process used to enforce and defend patent rights; by which the inventor is frequently deprived of the benefits of his ingenuity and tail, by the enormous expenses incurred in defending his property from pirates, tempted to perpetual estates dishonesty by the defect of derived to insure that the result of the present or ordinary common and special jury system to insure justice in patent cases.

That the result of the present very delective size of the patent system will be to rendered the case of the present

only designs.

That many of the defects of the present system are well known, being set forth in the

report of the committee of the Heuse of Commons, and jake in the report of the committee appointed by her Majesty's Government to inquire into the Privy Scal and Signet Office, dated January 30, 1849.

Your petitioners, therefore, most humbly pray that your Majesty will, as the gracieus patron of our arts and manufactures, direct such measures to be taken as will ensure at the proper time protection for all exhibitions of new inventions at the forthcoming Exhibition, in order to protect them from piracies to which they will otherwise be exposed, either by arrangements in connexion with the Provisional Registration of Designs' As, or by the adoption of such improved arrangements in regard to Royal Letters Patent, or otherwise, as may be deemed expedient, and with this view they humble actuar to draw attention to the said reports, and expecially to the recommendations of the said committee on the Privy Seal and Signet Offices (1849), in she hope that, in future, the grant of year on the Privy Seal and Signet Offices (1849), in she hope that, in future, the grant of year solid benefits which are so graciously intended to be bostowed thereby.

And your petitioners will over pray, &c.

THE CARDIGANSHIRE MINES. At no period for more than 100 years past have these mines been so prosperous, either actually or prospectively, as at the present time, though they have, as yet, by no means regained their ancient greatness. The year 1744 may be set down as the close of a career of brilliant successes, which had continued uninterruptedly from 1567, when was established the Society for the Mines Royal, under the management of the Earls of Leicester and of Pembroke, the Lord Mountjoy and others, who, by applying to the works the skill and talents of Houghselter and Thurland, two scientific Germans, met with such extraordinary returns as effectually and justly awakened the attention of the world to their great value. In the course of their subthe attention of the world to their great value. In the course of their subsequent prosperity, the amazing amount of wealth acquired by individuals, solely from this source, cannot be parallelled in any other field of contemporaneous speculation. Take, for example, Sir Hugh Middleton, who, from the profits of Cwmsymlog and Allt-y-Crib (then called Talybont), brought the New River to London, and Thomas Bushel, who, from the same mines, but in conjunction with Daren and others, was enabled to lend same mines, but in conjunction with Daren and others, was enabled to lend some mines, but in conjunction with Daren and others, was enabled to lend same mines, but in conjunction with Daren and others, was enabled to lend charles T. 40,000. for the payment of his soldiers, to clothe the whole of this army, and to furnish out of his miners a troop of 1000 horse, which he commanded in person in defence of his unfortunate king's too desperate commanded in person in defence of his unfortunate king's too desperate commanded in person in defence of his unfortunate king's too desperate commanded in person in defence of his unfortunate king's too desperate commanded in person in defence of his unfortunate king's too desperate commanded in person in defence of his unfortunate king's too desperate on the mines, says, "these are the chief which produce silver, now in working (1667), though not effectually, and by negligence herein we lose a million of money a year." From what calculation he arrived at such a conclusion, it is difficult now to say; but, at all events, it proves that the Cardiganshire mines were then looked upon as sources of unbounded wealth. Waller, agent to the company of Mine Adventurers of England, who were lessees of most of these about the end of the seventeenth century, estimates the clear annual profit of one vein alone at the high sum of 70,500. Notwithstanding all this, from 1744 to 1830, the mines were only parkingly, and, generally speaking, most inefficiently worked, either from a depression in the pri sequent prosperity, the amazing amount of wealth acquired by individuals,

To these may, undoubtedly, be added some more, which have escaped either the observation or the memory of the writer. It will, however, be seen from this, that there are not less than 73 mines in the county of Carsen from this, that there are not less than 73 mines in the county of Carsen from this, that there is in work—or at all events in lease; and about 33 unoccupied—the latter fated, perhaps, to be kept in reserve for the present, in order hereafter to verify the old mining adage, which declares that there is "ore for all ages, but not for all men."

Considerable activity prevails in lead mining in the Peak—this dept of trade having of late much revived. At Bradwell, all the long-ne mines are about being worked; at the Highrake there are good prospect at Eyam the business is very promising.

ANOTHER AMERICAN WONDER.—Our New York correspondent informs; that the "ninth wonder of the world" has been discovered in Wisconsin. It a cave extending under the greater portion of two countres. One field of the acave extending under the greater portion of two countres. One field of the acave extending under the greater acate that the cave, and a lake 37 ore was found three miles in extent? A water-fall is in the cave, and a lake 37 deep. A party lately passed three days in making explorations.

## IMPROVEMENTS IN FORGING IRON.

BY JAMES NASMYTH. ical Section, British As

Before proceeding to describe the nature of the improvements in question, Mr. Nasmyth made some remarks on the value and importance of any iment which tended to increase the certainty of the production of sound and perfectly solid forgings of wrought-iron, more especially those massive forgings required for such purposes as paddle-shafts for marine engines, crank and plain axles for locomotive engines, anchors, and such like; on lness of which both life and property, to a vast amount, may depend. Mr. Nasmyth instanced several cases in which paddle-shafts of marine engines had given way, although, in the first instance, they had all the outward aspect of the most perfect soundness, but which, on fracture, exhibited the existence of original defect, in being little else, internally, than a mass or bundle of loose bars of iron, which had never been in a sound welded union, but had only been held together by the exterior, where alone the welding had been so far perfect.

The chief cause of such defects was traced to the action induced on the

entre part of the metal of such shafts, by the action induced on the cylindrical forms betweeen two flat surfaces, as in the case of a forge hammer and anvil of the ordinary construction.

Mr. Nasmyth exhibited a diagram, of which fig. 1 is a copy, in order to illustrate the action induced on the centre portion of a cylindrical forging, when produced under the action of a flat-faced harmer and avril

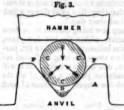

ed hammer and anvil.

forging, when produced under the action of a flat-faced hammer and anvil.

It will be seen at once that the action induced on the centre portion of the metal of a shaft or such like cylindrical form, by the successive blows of a flat-faced hammer and anvil, as A and B, is to cause the work to spread out or extend in the direction of E D, E C (as represented by the double pointed arrow in the figure), and as the flattened out form has to be attempted to be corrected by turning the shaft round and round on the anvil, so that each successive blow may be made to correct the spreading outcaused by the previous blow, theresult of this action is a fretting or mincing of the centre part of the metal of the shaft, resulting in a separation of the metal throughout the entire centre portion of the shaft, somewhat Fig. 2.

after the manner indicated in fig. 2, frequently to such an extent as to permit the passage of air or water from end to end of shafts forged in this manuer. The effect of this kind of unsoundness is, that it is certain, sooner or later, to work out towards the exterior, and, in all probability, result in a "break down" more or less disastrous in its consequences.

to work out towards the exterior, and, in all probability, result in a "break down" more or less disastrous in its consequences.

Mr. Namyth then proceeded to describe his improved form of anvil face, by the employment of which all such defects as detailed above are avoided. Such has been the perfect success and excellent results which have attended the use of his improved anvil face, that its adoption has become almost universal, and the production of absolately sound, solid, wrought-iron shafts, of whatever magnitude, rendered equally easy as certain.

A (fig. 3), represents the form of Mr. Namyth's improved anvil face, which he terms a V anvil, between the jaws of which the work to be hammered is placed, as indicated by a cylindrical shaft seen in section marked C, C, C. A glance at fig. 3 will, no doubt, render its action evident—viz., that the effect of each blow of the hammer on the work, C, C, C, instead of causing, as in the case of fig. 1, a diverging action on the centre portion of the metal of the shaft rendered less compact and solid by the action of the blows of the hammer, we have quite the contrary effect produced; besides which, owing to the wedge-like form and action of this V anvil face, the compressing effect of the blow is most importantly enhanced, and the ease and rapidity with which such cylindrical work as shafts and the like can be produced by such means is most remarkable, so much so as to enable the forgeman to hammer out at one heat, by means of this V anvil, as much as would require three heats on the common flat-faced anvil; add to which the vast convenience which the fork-like form of the V anvil yields, in keeping the work at all times right under the centre of the hammer, as it is turned round and round to receive the successive blows, which, in the case of work of the largest class, is a matter of no small trouble. Another keeping the work at all times right under the centre of the hammer, as it is turned round and round to receive the successive blows, which, in the case of work of the largest class, is a matter of no small trouble. Another advantage consists in the free passage, or exit, which is at all times preserved for the escape of the scales and impurities which fall from the hot iron during the process of hammering, which scales fall down towards the apex of the V at D, and trickle away—thus removing the cause of blemish and roughness which is occasioned by such scales collecting on the face of the flat anvil, and getting beat into the surface of the forging.

It will be seen, on inspecting fig. 3, that one such V anvil face as there represented will accommodate a vast range of diameter of work—namely, all diameters such as will neither absolutely rest on the bottom of the apex, D, or on the corners, F, F.

or on the corners, F. F.

all diameters such as will neither absolutely rest on the bottom of the apex, D, or on the corners, F. F.

Mr. Nasmyth has taken every means by the most free communication to promulgate among those interested the advantages of this V anvil, and has been rewarded by seeing its use become almost universal. Mr. Nasmyth stated that an angle of 80° was found by him to be most generally suitable for the inclination of the sides of the V, and also that the edges should be well rounded off, and the surface of the V sides curved in the direction of the axis of the work to the extent of \$\frac{1}{2}\$th of an inch in 12 inches, so as to be "prowd" in the centre, and so facilitate the extension (axis ways) of the work. The great simplicity, as well as the important results which are yielded by the employment of this V anvil face, has, in no small degree, contributed to its almost universal adoption. Its employment renders the production of perfect sound work easy and certain.

Mr. Nasmyth next proceeded to describe the second part of his improvements in forging iron, which consists, as in the first case, of means equally certain and simple in producing sound boiler-plates. Mr. Nasymth prefaced the description of his improvements on this truly important subject by detailing the nature of the most frequent cause of unsoundness of iron forgings generally, and in boiler-plates in particular—namely: the imperfect expulsion of the molten oxide of iron "scoria," or "cinder," tas it is termed, which, in every case of welding, but iron covers and clings so the surface of the metal; and, if left interposing between the welded surfaces, is certain to occasion a defect greater or less, according to the surface of junction it occupies. The frequency of this interposing scoria as the true cause of unsound forged work, was forcibly alluded to by Mr. Nasmyth, and shown to be the most fertile source and cause of the failure of wrought-iron work, resulting as such too frequently does in the most and and disastrous accidents—such as the fail of wrought-iron work, resulting as such too frequently does in the most and and disastrons accidents—such as the failure of the links of chains and anchors, and in the costly and often distressing results arising from defective (i. e., blistered) boiler-plates.

In respect to the links of chains. Mr. Nasmyth mentioned as the result

In respect to the links of chains, Mr. Masmyth mentioned as the resul of an extensive series of experiments on the strength of chain cables, o which, as member of the "committee on metals," he was employed by th

which, as member of the "committee on metals," he was employed by the Admiralty, out of every 10 cases of fracture, eight were occasioned by defective welding, as evinced by the appearance of the surfaces, which present to a practical eye appearances not to be mistaken, owing to the very peculiar aspect of the surfaces of the apparently welded metal, between which surfaces the oxide, or scoria, had not been duly expressed.

Mr. Nasmyth further described the condition absolutely requisite to perfect welding—namely: not merely that the surfaces we desire to weld should be really "welding hot," but also that, when brought into contact, no particle of the scoria, which inevitably clings to the metal while welding hot, should be permitted to remain interposing between such surfaces. If such material is left interposing, we are certain to have defect and unsoundness, to a greater or less extent, as the result.

In order the more clearly to detail his improvements on this important subject, Mr. Nasmyth exhibited a coloured drawing, representing the usual form and arrangement of a "pile" of "slabs," such as are employed when welded together, to form a mass of iron, from which boilerplates, or bars of iron, are rolled. Fig. 4 represents such a "pile" of "slabs "which, having been, as is generally the case, produced under the action of a forge hammer and anvil, having flat or, as is generally the

case, slightly conver surfaces, causes the slabs so produced to have certain hollow parts, or slightly concave portions of their surfaces, so that, when piled one upon the other, as in fig. 4, the risk of having hollow spaces is almost certain. The hollow spaces are represented in the figure by the dark irregular lines between the slabs.

Fig. 4.

Referring to fig. 4, A, B, C, D, represent a pile of four slabs, laid on the anvil welding hot. Owing to the concave irregularities of the surfaces, the parts most certain to come into contact first are generally the exterior edges of the slabs. The effect of the blows of the hammer is first to weld the parts in natural contact, and by continuance of the blows the interposing scoria, or cinder, is expressed in a degree more or less perfectly, according to the energy of the blows, and the deepness of the convex, or hollow patches, betwixt the slabs. So long as there exists an exit, or passage, for the scoria all is well; but, as generally happens, some portion of this scoria lurks behind, after all chance of escape is removed by the welding of the exterior portion of the surfaces of the slabs. The result of this is that we have, to a certainty, a defect, greater or less in amount, according to the quantity, or surface, over which the enclosed scoria extends. Once such scoria is shut up between the surfaces of the slabs no amount of after hammering will ever expel it, but, on the contrary, will only tend to its extension over a larger surface; and, as before said, so long as a particle of this scoria is left interposing, so have we a degree of unsoundness in proportion.

Great as this evil is, and common as it is as a fertile cause of defective

will only tend to its extension over a larger surface; and, as before said, so long as a particle of this scoria is left interposing, so have we a degree of unsoundness in proportion.

Great as this evil is, and common as it is as a fertile cause of defective ison-work, and the more especially so in the case of boiler plates, the means of avoiding such source and cause of defect is as simple as the results are important; and it is to be hoped that the free and open communication which Mr. Nasmyth has made of his views on this subject will be answered in the most acceptable way by the general adoption of his improvement, as certain means of avoiding the occurrence and existence of all such causes of defective boiler plates and forge work generally, which improvements consist simply in so forming the surfaces which we desire to weld together that a free exit may be preserved to the last for the escape of the molten oxide, or scoria, until the entire surfaces of the parts we desire to weld are thoroughly incorporated by the welding property, under the action of the hammer, or rolls, as the case may be.

Fig. 5.

In order to accomplish this most important and desirable object, Mr. Nasmyth forms the surfaces of his slabs convex (see fig. 5), by which most simple means a most perfect free exit to the scoria or interposing impurity is maintained to the last moment, the welding commencing at the centre, who weld we have the most certain and simple means of procuring a perfectly solid sound mass of iron, which, when beaten, hammered, or rolled down to whatever thickness we desire, will retain to the last all the qualities of the one sound solid mass we had converted it into by this most simple improvement—viz, giving to the surfaces we desire to weld a convex form, and relation to each other.

Mr. Nasmyth concluded his observations on these important subjects by an earnest appeal to the members of the mechanical section to diffuse, by all means in their power, the information which, on this as on all such subjects, he w

ON SOME OF THE USES OF PYROGEN IN NATURE.-No. IV BY JOHN JOSEPH LAKE.

The disturbance of the electric state of the earth, and origin of terrestria nagnetism, is to be attributed to many causes. The sun affects it, as in rendered evident by the influence of that body in producing the daily riation of the needle. The unequal heating of the surface of the earth also assists in producing the disturbance, as is proved by Lubeck's discovery, assists in producing the disturbance, as is proved by Lubeck's discovery, that the application of heat to the point of junction of two different metals (as bismuth and antimony, and bismuth and copper) creates a current. Christic's experiment, with a disc of bismuth surrounded by a ring of copper, shows the same thing; for heat being applied to the edge of the copper an extraordinary amount of magnetism is developed, two poles (north and south) being produced at certain points on one surface, and poles of an opposite character (separated from them by the thickness of the bismuth only) on the opposite surface. Professor Christie endeavoured to extend this experiment to the case of a spherical copper shell filled with bismuth and heated generally at the equator, but more particularly at one point, and the results appeared, to a certain extent, to correspond with the state of terrestrial magnetism. But there was a degree of uncertainty in the results, owing, probably, in part to the difficulty of insuring a good union between the copper and bismuth. In these experiments the source of heat is from without, but the heat of the earth is rather to be looked for from within, for the amount of heat in the sun's rays is very uncertain, and, probably, very small. The heat that they produce is rather to be viewed as an action resulting from contact, than any essential property of heat that they possess.

(The everyment of a metal ball revolving with its exist a narrole with ent of a metal ball revolving with its axis at an angle with

The experiment of a metal ball revolving with its axis at an angle with the magnetic dip affords a key to the real source of terrestrial magnetism, for the earth must revolve at angles with the solar magnetic dip, because the plane of the axis of the earth forms an angle with that of the sun. Therefore, if the magnetic axis of the sun coincide with its axis of revolution, the axis of the earth is always at an angle with it, and if the solar magnetic axis does not coincide with the axis of revolution, the axis of the earth and the solar magnetic axis can never be in the same relative position two seconds together. This, therefore, becomes a permanent source of electrical disturbance in the earth.

The sun in like manner, may owe the electrical disturbances that were

tion two seconds together. This, therefore, becomes a permanent source of electrical disturbance in the earth.

The sun, in like manner, may owe the electrical disturbances that produce its electro-magnetic condition to other systems, or partly to the reaction of its own planets. Its axis of revolution forming an angle with the Milky Way would be quite sufficient for the purpose. There seems, in fact, to be strong reason to believe in the existence of such an influence as this; for when the earth is in that part of its orbit that is nearest to the widest and densest part of the Milky Way, the variation of the magnetic needle is seriously affected. During the three months between the vernal equinox and summer solstice, it retrogrades towards the east, and during the other nine months of the year its general motion is towards the west. In October it has nearly the same position as in May, and then for four or five months the western motion is smaller than during the three preceding months—that is, during the three months the earth is passing from Libra to Capricornus, the variation changes as rapidly as during the remaining nine months of the year, and whilst it is passing from Aries to Leo the change is least. This is what we might expect from the influence of the Milky Way. At its densest part it sends back the needle, but at the opposite side its power is not sufficient to cause the needle to retroof the Milky Way. At its densest part it sends back the needle, but at the opposite side its power is not sufficient to cause the needle to retrograde, yet it has sufficient energy to check the variation. This variation of the needle seems to afford a clear proof of the electro-magnetic state of the Milky Way. It is, indeed, only by some extraneous influence of this kind that the phenomena of the annual variation can be explained, for no reason can be assigned why the sun should act for three months in one way, and nine months in another. Were the sun alone the cause of this variation the effects would be more regular, and the return of the magnetic needle to the same position might be expected to occur at regular intervals. It is also of importance to note that the daily variation is seriously affected whilst the earth is passing onward through Libra, Capricorma, and following signs—that is, during the spring, the variation being generally greater at that time than during the rest of the year.

Ordnance-office, Portmouth, Oct. 15.

THE COPYRIGHT OF DESIGNS AMENDMENT ACT.—On the 14th August an Act was passed (18th and 14th of Victoria, cap. 104) to Extend and Amend the Acts relating to the Copyright of Designs. By this Act designs may be provisionally registered for a year, which will secure the benefit of the design to the proprietor, and, although exhibited, will not defeat the copyright. Sculpture, models, &c., may be registered. The Board of Trade may make regulations for the registration of designs.

## Original Correspondence.

FOURDRINIER'S PATENT SAFETY APPARATUS

Sir.—Looking over the Journal last week, I saw an account of how an accident had been prevented at Belmont Colliery by the use of "Fourdrinier's apparatus;" the writer was in error in supposing that it was the first instance in which an accident had thus been prevented. I enclose you a memorandum which Mr. Higgitt, my agent, handed to me yesterday, or naming the subject to him.

Timitey Park Colliery, near Sheffield, Oct. 16.

BREAKAGE OF ROFE.—On the 10th of August last, as the carriage and empty corre-weight about 7 cwts., saspended at the end of the rope, was descending No. 1 pit, dept 120 yards, the rope broke when the carriage was about half-way down the pit, and while would have fallen to the bottom, and done a deal of damage, had it not been for the activy apparatus, which caught and held the weight until another rope was let down traise it to the top.

FOURDRINIER'S PATENT SAFETY APPARATUS.

Str.—Observing in last week's Journal the letter of your correspondent, "P. R.," on the subject of the adoption of my "safety apparatus," I think it a duty on my part, and an act of justice to the proprietors of the Killingworth Colliery, to inform him that those gentlemen gave me their orders some weeks since to fit my apparatus to their cages, and which are now in a forward state. I have every reason to believe that my invention is becoming duly appreciated, as I am daily receiving orders from this and other influential districts.—E. N. FOURDRINIER: Sunderland, Oct. 16.

### BIRAM'S MINERS' LAMP.

BIRAM'S MINERS' LAMP.

Sire,—I am at all times glad to hear of an attempt to lessen the danger to which the miner is daily exposed, and as that of Mr. Biram has produced a lamp, at first sight an improvement on the original Davy, but in reality anything but an improvement as to the safety of the workmen, I trust a few words on its merits or demerits may not be deemed out of course. Before pointing out defects, let me observe that I do so in a good spirit, and not with a view to throw cold water upon the humane sodeavours of any, and more particularly those of Mr. Biram, to whom as a miner I feel deeply indebted for his consideration; and I trust anything that falls from me may not deter him from continuing to give the subject his attention, so that better results may obtain than has yet appeared.

The reflector is calculated to overheat and render dangerous the wire gauze in case of an internal explosion, the low temperature of and between the wires constituting the principal safety of any wire gauze lamp. The interior of the lamp is of such dimensions as to admit of a large accumulation of gas inside, increasing thereby the liability of the flame to pass through the meshes of and to force out the gauze in front of the lamp. The bottom fits into its place, and is secured admirably; but while this door is closely shut and locked, the other (the top gauze), through which a reckless workman has as ready access to the naked flame as he could wish for, is not botted.

Mr. Biram will, perhaps, consider a second time whether his lamp is a safety lamp, or whether it is an improvement on the old Davy; and I will venture to say, if he does not agree with me, that it is neither one or the other, that he will not deem me an intruder, when I assure him I have the same object in view as he apparently has had—namely, to be of service in the humane act of saving life.—A Durham Pitman: Oct. 10.

ON THE INSPECTION OF MINES.

ON THE INSPECTION OF MINES.

Sir.—I have read in your Journal a copy of the remarks of the North British Daily Mail, on the recent prosecution of the managers concerned in the explosion of fire-damp in one of the Airdrie collieries; and as prosecutions of this kind are now becoming so very common in Scotland, perhaps you could inform your readers on the steps which are usually taken by the Procurator Fiscals in obtaining their information of the particulars of the accidents on which such prosecutions are based.

If it is true that the police force are the principal, if not only, medium through which their information flows, then it is somewhat strange that a power so inquisitorial should be intrusted to men possessing neither any practical knowledge of mines, or of the dangers attendant upon them. For, however judiciously the power invested in the fiscals may be wielded by them, it is of too arbitrary a description to be popular, and as the fiscal's fees depend upon his cases, it would be more in unison with the general tenor of our laws, if such prosecutions depended more on the report of a competent and disinterested practical mining engineer, who could better distinguish an act of culpable negligence from a mining casualty, than one who is only noted for his legal acquirements.

Under the present system, if an accident happens, no matter of how unavoidable a description it may be, there is no certainty that the manager will not be committed and tried as a felon; and it is a poor recompense to him, after being withdrawn from his friends, and suffering great anxiety of mind, and probably ruined with the costs of his defence, to be told that, after a careful inquiry into the matter, he is honourably discharged. Such cases are too common, and if the recent Mine Inspection Act throws a salutary controul over the future, it will confer a boon on the managers of works in Scotland.—South Wales: Oct. 15.

## PYROGEN AND ELECTRICAL CONDITION.

Sir.—Granting to Mr. Lake the interpretation which he attaches to "pyrogen," and that at the time of its introduction it was a better term than electricity, recent discoveries, I think, render it altogether inappropriate, and unless a term can be found that shall compass all the properties of that all-pervading fluid in Nature, the most unmeaning is, perhaps,

e best. Electricity is now the acknowledged cause of gravitation, to which a

the best.

Electricity is now the acknowledged cause of gravitation, to which a "begetter of fire" can have no reference; it is also the bond in matter which fire destroys, and matter being drawn to the centre of the earth, which is negatively electric, or repelled from the highly electric upper regions, with a force equal to the electrical condition of the body, by contraction, or compression, matter actually increases in weight—weight being nothing more than the indication of the force with which two bodies, in similar or dissimilar electrical conditions, repel, or attract, each other; or with which fire can have no connection.

Mr. Hopkins, in his elaborate work on Terrestrial Magnetism, of 1844, very properly observes that heat is not the cause but the effect of chemical action—a tremendous inroad on the fallacies of chemical science, the truth of which subsequent discoveries have fully confirmed; and although we are not yet in a condition to be able clearly to demonstrate how electricity acts in producing the various phenomena of this extensive branch of natural philosophy, still quite sufficient has been done to place beyond doubt that chemical action is referable solely to electricity, but to which "pyrogen" can have no reference; more especially in the operation of crystallisation; much less will it convey to the mind an idea of the action on each other of two or more bodies, such as salt and ice, which causes their mutual decrystallisation, or "thaw," although in a menstruum, the temperature of which is from 20° to 40° below 0, as in freezing mixtures.

To Mr. Lake, as I have already observed, science is indebted for the interesting facts he has elicited in connection with electricity; but what he means by stating that he is the first, and, as far as he is aware, the only person that ever produced experimental proof of the existence of pyrogen, I am utterly at a loss to understand. Does he mean to say that when Franklin brought down electricity from the clouds—charged with it a jar, and showed that it

I am utterly at a loss to understand. Does he mean to say that when Franklin brought down electricity from the clouds—charged with it a jar, and showed that it was identically the same fluid that was produced with a machine, he did not afford experimental proof of the existence of electricity? Franklin considered "positive" and "negative" to be merely plus and minus; and he found that, if he connected two insulated bodies with the wises of a machine, he could transfer the electricity of the one to the other, and that on approaching the two bodies to each other the balance was restored. Bat electricity has been identified with heat instead of with cold; and the scientific world has been but too successful in undoing all that Franklin had so wisely done, and, therefore, have imposed on Mr. Lake and others the task of putting things back as they were. I may, perhaps, mention that, when at Broomfield, in 1847, I was informed by Mr. Crosse that, by placing a piece of glass between the points of his powerful machine, he had succeeded in piercing a hole in it, but when the experiment was made I cannot say.

Whether the credit of suggesting that the atmosphere of a body is in a different electrical state to that of the body itself be due to Mr. Lake or myself, is a question that must be left to the decision of others, although, probably, it is one respecting which the present generation will not much concern itself; but, in reference to what Mr. Lake states respecting Mr. Sturgeon's experiments with electric kires, I deem it due to my late much esteemed friend, Mr. Weekes, to annex the following extract from one of

his letters, affording evidence of his claim to the discovery which Professor Faraday, in his injudicious lecture, assigned to Pelletier and Quetelet; it is dated 15th Feb., 1850:—" Crosse had his exploring wires carried out at least 30 years ago. Mine have been in existence 10 years, but they differ entirely in their mode of insulation, and in their terminal arrangements, &c., from the Broomfield apparatus. My electric kite experiments were made upwards of 20 years since, and have been almost yearly repeated. They were made public, almost as soon as I became convinced, through several scientific institutions to which I was then lecturing, in some of the periodicals of that day, and were freely communicated to my scientific friends in my letters. I have lately seen that my old friend, Mr. Sturgeon, of Manchester, has arrived at similar conclusions by the same means. I believe he did not know what had been done by me. He would be too honest not to mention it if he had known." Franklin Coxworthy, Canterbury-place, Lambelh-road, Oct. 12. Author of Electrical Condition.

## PYROGEN.

Sir.,—In reply to Mr. Dumaresq's inquries in your Journal of the 12th inst., I beg to state that the subject of terrestrial magnetism has long engaged the attention of the scientific world; but, up to the period of the scientific travels of Humboldt, the facts with which we were acquainted

gaged the attention of the scientific world; but, up to the period of the scientific travels of Humbold; the facts with which we were acquainted had not been reduced to a science.

M. Biot was the first who undertook the difficult task of reducing the existing collection of observations to some principle of calculation. In the meantine, a similar task had been undertaken by M. Kraft, of St. Petersburgh, but on different principles. The latter philosopher, in attempting to connect the different observations on the dip with each other, discovered this very simple relation—viz.: "that the tangent of the dip of the earth, in any place, is equal to double the tangent of the magnetic latitude of that place."

These philosophers also arrived at the following conclusions from their investigations of the subject:—1. That the laws of terrestrial magnetism are inconsistent with those which belong to a permanent magnetic body.—2. That they are perfectly coincident with those which appertain to a body in a transient state of magnetic induction. Up to this time there was only one way known of inducing magnetism—namely, by applying a magnet to impure iron, nickel, &c. M. Oersted's discovery, however, showed that any substance, capable of conducting an electric current, might be rendered temporarily magnetic. This discovery led to Prof. Barlow's experiments with an artificial globe, and Dr. Faraday's subsequent investigation of the subject, when the latter arrived at the following conclusion, amongst others:—"Upon the supposition that the rotation of the earth tending by magneto-electric induction to cause currents in its own mass, these would, according to the law (referring to a law previously illustrated) and the experiment, be upon the surface, at least from the parts in the neighbourhood of, or towards, the plane of the equator, in opposite directions to the poles."—(Baheriun Lecture, Philosophical Transactions, 1832, p. 163, par. 182.)

Mr. Evan Hopkins, however, assumes that the electric currents pass into

neighbourhood of, or towards, the plane of the equator, in opposite directions to the poles."—(Baherian Lecture, Philosophical Transactions, 1832, p. 163, par. 182.)

Mr. Evan Hopkins, however, assumes that the electric currents pass into the earth at the north pole, and out at the south; and in this his theory differs with mine, and the results of Profs. Barlow and Faraday's experiments. It is, indeed, hard to conceive how a state of things, as represented in the plates of Mr. Hopkins's work, could exist; and as he gives no explanation, but merely an idea in a figure, I refrain from saying more on the subject; for I would not disparage his excellent work, which appears to have been chiefly designed for mining purposes, and for such is very good. The difference between pyrogen and electro-magnetism is a temporary magnetism, produced in bodies by causing currents of pyrogen to circulate about them.—J. J. LAKE: Ordnunce-office, Portsmouth, Oct. 15.

## LUNAR GEOLOGY.

SIR,—I confess it has always appeared to me a singular method of investigating the structure of our own globe, by making reference to mountains in the moon. It reminds me of that ironical allusion of the great Lord Bacon to the speculations of certain learned men, which he tells us "are like the stars which give but little light because they are so high;" and, certainly, when we have the surface of the earth before all our senses, at the command of every test of science, and not the surface only open, but perforations of the interior, it does appear a most refined and exalted method of investigation to turn our back upon this dwelling place, and seek a knowledge of our home by telescopic data, gleaned from the distant habitations of our neighbours. Is it not like taking a voyage to China to get some insight to the meaning of parliamentary debates? The alleged volcanos of the moon have long been subjects of speculation, but it surely is a hazardous affair to reason upon them. We are told the moon possesses neither air nor water—two considerable differences, which must rather impair the completeness of any analogies we can draw through a telescope. In the late speculations by Mr. Nasmyth, abstracted in your pages, we have a specimen of what my be called the double hypothesis, in which assumed theories respecting this earth are brought to explain alleged lunar facts, and then these compound lunar theories so constructed are, by the fair exchange of doubless a free trade, again imported hither to explain alleged terrestrial facts. The fundamental proposition of Mr. Nasmyth's selenology is the old theory of the grantic or crystalling errast and then these compound lunar theories so constructed are, by the fair exchange of doubless a free trade, again imported hither to explain alleged terrestrial facts. The fundamental proposition of Mr. Nasmyth's sclenology is the old theory of the igneous origin of the granitic or crystalline crust of the earth. I do not exactly understand why this formation has been pre-eminently distinguished over all other rocks as the crystalline; as all other rocks (nay, even coals) are equally divided by their planes and cleavage into a sort of crystalline masses, which masses also comprise some crystals within them, we might by a certain well-known logic maintain the identity of both kinds "because there are crystals in both;" but, in sober carnest, I cannot discover, either in the stratification or, in the texture of granitic rocks, any differences from those rocks which are especially designated "sedimentary," which can bring before the mind the slighest traces of that igneous origin, of which every ironmaker at least may study some of the symptoms and effects in his own slags. Mr. Nasmyth's geology is founded upon two assumptions directly the reverse of each other—in fact, mutual negatives. The first is the compression of the fluid interior, by a cooling crust, so as to force out the confined ingests; the second is the exhaustion or contraction of that fluid interior, so that the hollow crust may fall in, for the purpose of creating valleys and boulders. Assuming for a moment that such compression could exist (which is, in fact, out of the question), what is the other power that is to force out the liquid interior to produce these vacuities, after the hypothetical compression has ceased? By what energy are tens of hundreds of millions of tons of liquid matter to be exhausted from beneath the crust for the convenient purpose of allowing it to fall in with a splash, to create hundreds of square miles of valleys, or low lands, or submarine continents; and what has become of these enormous torrents of matter so ejected? Th compression and volcanos, I cannot understand it in any other light than as a pure effort of the unmixed science of imagination. What instance from terrestrial physics can be brought forward to support it? Does the bursting of an arch by the pressure of passing water encourage the belief in the ability of a circle of 20,000 miles of congealing matter to compress the fluid upon which it is floating? Suppose the crust to be 100 miles in thickness, about 1-60th part of the whole diameter; this may be taken to represent a water cultyer 10 feet diameter; having to support the whole the find upon which it is floating? Suppose the crust to be 100 miles in thickness, about 1-60th part of the whole diameter: this may be taken to represent a water culvert 10 feet diameter, having to support the whole pressure of its contents a brick circle of 2 inches thick! Or, taking the ordinary assumption of about 30 miles of crust, this brick arch must be reduced to a thickness of 6-10ths of an inch, surely a very powerful agent of compression! Besides, as the cooling and consequent compression must be gradual, why is the enclosed fluid to wait obligingly until the crust is thick enough for the theory, and make no exit until the volcano is properly got up? Further, the law of fluids passing into the crystalline state is expansion, and not contraction. Icebergs do not compress the water by an increase of weight, but float in it and upon it. The coat of ice covering a pond does not compress it and raise aqueous volcanos over its surface. If the crust cracked in the subsequent cooling after it had become solid, the melted fluid below would rise to its level in those cracks, abolishing the volcanic necessity; but assuming solidification possible, even this kind of cooling contractin occuld hardly take place over the supposed temperature of the interior. The truth is, such theories are based on a most partial and incomplete estimate of relations, which are not positive, but have only a comparative value. A mountain of granite is certainly in one sense a very ponderous affair, if the imagination attacks it without proper assistance; but, when adequately considered, all the granite mountains in the world, when floating upon the assumed sea of glass

would have no more power in compressing it than walnut shells floating in a tub of water exercise upon the hoops which confine the vessel; and, if the heat producing fusion proceeded from within, in some way which it is quite impossible to account for, how could any cooling or concretion of the surface be effected against this emittant agent of dissolution. The only kind of fusion which appears to be at all admissible, is such as I have referred to in the case of ærolities, arising from the sudden passage of undecompounded substances into an oxidizing medium; but whether this ever did take place or not on our globe, I can trace no general evidence of it on the surface—its testimony must exist far beneath out of the reach of aqueous action. If such splashing catastrophes as Mr. Nasmyth supposes had been employed to prepare the earth (according to the phrase) for man's habitation, the great geological feature of the globe must have been not granite, but pumice stone. Why is the granite of a uniform texture? why is it not translucent in peaks and promontories, and opaque and stony in quarries and mines? One day's study at some of the ironworks near Reinburgh, with a bucket of water for his companion, might give a philosopher juster notions on this subject than a hundred lunar years of telescopic examination. Does not Mr. Nasmyth's own assumption of the lunar matter being lighter than cork make a sad invasion on the integrity of his analogies; and as to the comparison of our eartiffs surface. Mr. Hopkins, on the contrary, attributes everything to the constant government of magnetic energy. And who can see the planes of stratified or "crystalline" rocks laid bare before him, and trace their rising lines, without recognising the strength of a vital energy which has commanded them into their positions. There is nothing which appeals to the mind with a more forcible impression of a lively and meaning movement than the onward stretch of rocks in their rising planes. We may be as yet at an immeasurable distance from real

## FORM OF THE BLAST-FURNACE.

-I was pleased with your extract from Mr. H. Fairbairn's pape in an American journal, on this subject. He is undoubtedly right as to the superior effects of a curved section; but its fall efficacy depends on the position of the various chords upon which the curve is constructed. If the top of the bosh is the widest part of the furnace, and the chord of the curve be drawn from there to the edge of the filling place, that is decidedly a defective shape; and it is by no means new. Furnaces, limekins, &c., have long been curved in that manner. The carrying up the walls as a mere cylinder from the boshes for a considerable height, which he censures, is also defective. I have seen many furnaces so built in different parts of this country, with the intention of carrying out Mr. John Gibbons's principles. It is an approximation which saves some trouble in building; but it does not provide for a further expanded by the very mass accumulates heat, and copiously provides for deoxidation. From the top of the boshes the walls should continue to expand, until they reach at least half the beight of the whole furnace. If the width at the boshes be 12 ft, and the diameter is further expanded to-15 ft, at 8. ft above the boshes, and the contraction commences there, the area of the most valuable region for deoxidation will be intereased more than a third, giving nearly 600 cabical feet more of materials to be acted upon, with the additional power of an accumulated mass. All shis is more than lost, if the curve commences at the top of the boshes; for the disposal of the blast upwards is quite as important a consideration as the pressure of the material downwards. I do not gather from the extract whether Mr. Fair-bairn proposes this point as the commencement of his curve; but, if so, the mere cylinder is preferable, as least for ordinary materials. Anthracite may, and does, require particular arrangements; but mass must be quite as important an element of economy in an incombustible as a combustible fuel. The proportion he gives for the filling orifice—mamely, one-third of the extreme diamete in an American journal, on this subject. He is undoubtedly right as to the superior effects of a curved section; but its full efficacy depends on the position of the various chords upon which the curve is constructed

such curve would retreat from the direct line of the blast, and so far withdraw materials from its action. If any curve is employed here, it should be with the convex towards the interior, but not a segment of a circle. It should rather be parabolic, so as to be nearly straight on the boshes, and the curvature increasing, until it rounded off the angle at the top of the hearth; but this is a nicety hardly worth attending to. If the boshes are built straight with the right slope, the blast will soon effect the other modification. In fact, as long as Mr. John Gibbons's treatise is in print, there is no ground for the complaint of proper information being wanted on this subject. His section is complete in principle, though he has since found it practicable to carry his views out further, as he desired, by a much greater diameter of hearth. meter of hearth

greater diameter of hearth.

It is striking to see an attempt at correct notions proceeding from foreign sources, whilst vague views are still prevailing in this iron-making country. Some of your correspondents, for instance, have proposed to reduce the blast-furnace to a height of 20 feet, to economise heat and fuel, and cure the red-short and cold-short in its produce. There are two kinds of economy—the one is reducing expenditure, the other applying it to advantage. As the quantity of iron made depends upon the amount of expenditure, under proper conditions, of blast and fuel; it is evident a reduction of these will only reduce produce, which will be no economy. A certain quantity of fuel must be consumed at the tuyères, in order to bring down and melt a certain quantity of materials. In doing this A certain quantity of fuel must be consumed at the suyères, in order to bring down and melt a certain quantity of materials. In doing this a certain amount of heat is necessarily generated; the only kind of economy, therefore, that is available, is the due application of this heat after its production. The present blast-furance applies the surplus successively to all the stages of cementation, deoxidation, and the expulsion of volatile matter, and the height is carried up until no more heat remains so available. But by shortening the blast-furance to 20 ft., at which region the materials are at a white heat, and building a vault over them, that temperature which is now made useful in preparing 25 feet of materials above, would be merely expended in the rapid destruction of the dome. The high tem-

parature into which the materials would be filled, would fuse them with perature into which the materials would be filled, would fase them without any proper preparation, the sulphurets especially would be liquified
at once, without the slightest chance of volatilisation, or neutralising combination; and in what way this would promote the removal of either redshort or cold-short from the produce is quite as difficult to appreciate as
any other part of the proposal. It is always to be regretted when ill-considered changes are advanced as beneficial, because the course of genuine
improvement is checked, and discredited by plans which are opposed to
principle and experience, and attack their intrinsic merits with the name
of error.—David Musher: Oct. 11.

#### IRON TRADE-IRON ORE.

IRON TRADE—IRON ORE.

SIR,—I have been much interested by the articles on "iron ore" (hematite) contributed to your valuable Journal by Braithwaite Poole, Esq., and David Mushet, Esq., and others. Perhaps the latter gentleman, or some other of your correspondents, experienced in mining and practical geology, will oblige me and your numerous readers with a geological description of this valuable mineral (hematite), accompanied with such remarks as may lead to its further discovery, particularly the geological character of the district, and the surface indications where it may be found. The very limited and few districts known to produce hematite suggests this inquiry.—B. W.: Whitehaven, Oct. 16.

## THE EXPLOSION OF STEAM-COAL AT CARDIFF.

Sir.—In your valuable paper of the 21st Sept., I read with much concern the account of a serious accident at Cardiff by the explosion of a cargo of steam-coals on board the Gertrude, Capt. Newman, bound to Liverpool, together with your correspondent's remarks from Cardiff. I fully agree with your correspondent that too much caution cannot be taken in adopting the necessary means of preventing such fearful consequences; but it would be very desirable to know from what descriptions of coal are most to be apprehended such a fearful result.

Nauxicus.

ost to be apprehended Cardiff, October 10.

### THE EMERY OF ASIA-MINOR, AND THE MINERALS ASSOCIATED WITH IT-GEOLOGICALLY.

BY M. J. L. SMITH.

Among the various mineral substances employed in the arts, emery is, perhaps, the one whose geological character has been least examined, and respecting which there is most yet to be learned; yet, in both a practical and scientific point of view, the enquiry into the geology of this substance is full of interest. The existence of emery in Asia-Minor was not known up to the year 1846. At the commencement of the following year, I discovered this mineral in situ for the first time in Asia-Minor; but since that period. I have discovered it is neveral leading in the commencement of the same control. portiod, I have discovered it in several localities in the same country. The period, I have discovered it in several localities in the same country. The principal situations in which emery is found in Asia, are—Gumuch-dagh and Kulah. The first of these is a mountain, near the interesting ruiss found by the French traveller Poujoulat to be those of the ancient Magnesia. The second, Kulah, is in that part of Asia-Minor called Catace-cummeny, or the country of fire. The geological formation of these places consist essentially of metamorphosed limestone, overlying micaceous schist, gneiss, &c. The marble of Kulah has undergone a complete metamorphosis at its surface by the action of the lava which, in former ages, flowed from the numerous volcanic craters which give to this region its peculiar aspect. The other new localities in which emery is found, are Adula and Manser in Asia-Minor, and the Isles of Samos and Nicoria. The emery gneiss, &c. The marble of Kulah has undergone a complete metamorphosis at its surface by the action of the lava which, in former ages, flowed from the numerous volcanic craters which give to this region its peculiar aspect. The other new localities in which emery is found, are Adula and Manser in Asia-Minor, and the Isles of Samos and Nicoria. The emery is embedded either in the soil which covers the limestone, or in the rock itself. It is found in masses, some of which are no larger than a pea, while others contain some thousands of kilogrammes. The fragments of emery are generally angular, but they are also sometimes rounded, although they do not seem to have taken the latter shape by attrition. The masses which are formed in the soil above the limestone do not offer much interest to the geologist, as it is evident that they are merely brought into that situation in consequence of the disintegration of the rock in which they were originally embedded, or that they have been transported from some other locality; it is, however, difficult to admit the validity of the latter supposition, after what may be seen at Gumuch-dagh, for there it is only at the summit and not on the sides of the mountain that the emery is found. After some investigations into the nature of emery, and the rocks associated with it, I have come to the conclusion, that this substance has been formed and solidified in the limestone in which we at present find it; and that it has not been detached from more ancient rocks (such as granite, gneiss, &c.), and then deposited in the limestone at the epoch of the formation of the latter. My reasons for thinking thus are as follows:—The most careful researches in the older rocks in the neighbourhood (in the limestone rock never contain any foreign deposit. Although we find mica schist in the limestone at Kulah, it is never in contact with the emery, and never contains the least quantity of corindon. I consider this important to my view; for, in the specimens which I have obtained, the calcareous wate

cisely the same as that which occurs where ferruginous and aluminous minerals are formed, and afterwards separate from limestone not yet completely solidified. There are other reasons for supposing that emery is formed in the limestone rock by a process of separation. I have a specimen which shows this in a remarkable manner; it is a nodule, in which the nucleus is surrounded by two distinct concentric layers: the nucleus consists of emery, the next layer of chlorotoid, and the exterior of emerilite—the last being in contact with the rock. The constituents of this specimen have the following composition:—

Emery.—Mixture of corindon (alumina slightly hydrated) and oxide of iron. Chlorotoid.—Silica 24, alumina 40, oxide of iron 28, water 7. Emerlite.—Silica 30, alumina 50, lime 13, water 6.

In proceeding from the external surface to the centre, the greater part of the silica will be found combined with a large proportion of alumina and some lime, forming a particular kind of mineral; next, the remainder of the silica combines with a further portion of alumina, and a considerable quantity of oxide of iron to form the chlorotoid; and lastly, the alumina and oxide of iron, which remain, crystallize separately, the homogeneous attraction of their particles being greater than their chemical affinity for

and oxide of iron, which remain, crystallize separately, the homogeneous attraction of their particles being greater than their chemical affinity for each other. Effects of this kind are not rare, and they are always worthy of remark. In concluding the considerations relating to the geological character of emery, with respect to Asia-Minor and the neighbouring islands, I cannot help expressing a belief that future investigations into this subject will show that emergence and the subject will show the subject will show that emergence and the subject will show that the subject will show the subject will sh this subject will show that emery constitutes a geognostic character and peculiarity for certain limestone deposits in this part of the world, in the same manner as the nodules of flint do for the chalk of Europe. With regard to the mineralogical character of emery, I think it ought to be considered rather as a rock than as a mineral, and that it consists of a mixture of corindon and minerals of oxide of iron, more or less associated with other mineral substances of a similar class.—Comptes Rendus.

LIABILITY OF RAILWAY COMPANIES.—The jury, in an action just tried at Romford, have returned a verdict of 31L against the Eastern Counties Company for injury sustained by Mr. Henderson, a solicitor, while entering a train, an consequence of there being no lights at the Forest-gate station—a deficiency which has since been supplied.

REFERENCE STATE PROPERTY OF THE PROPERTY OF THE

BRITANNIA BRIDGE.—The Government inspector is to go over the second

great tube on the 19th.

RHBUMATISM—A WONDERFUL CURE OF WHICH DISEASE HAS BEEN REFROTED BY HOLLOWAY'S ORTMENT AND PILLS,—Mr Donald M'Kellar, of Murrumbidge,
New South Wales, states—"That a man of about 30 years of age, employed by J. Peter,
Esq., justice of the peace in this colony, suffered for 12 months from an attack of rheamaism, brought on by exposure to wet and cold. He was so painfully afflicted that his
body was bent nearly deuble; in this deplorable condition he commenced using Holloway's olatinent and pills, and so speedily was the cure effected by them, that it seemed
to those who had wimeased his sufferings little less than a miracle."—Sold by all druggless,
and at Professor Hollowsy's establishment, 244, Straud, London.

No. 82, THREADNEEDLE-STREET, LONDON.

Mr. R. TREDINNICK begs to inform his Friends and the Public of his REMOVAL to a above COMMODIOUS ROOMS, in the Hall of Commerce, where he purposes to hold, addition to his general Agency Business, PERIODICAL SALES, BY AUCTION, of HARES in MINES, RAILWAYS, BANKS, CANALS, INSURANCE, and OTHER OMPANIES; also Reversions, Annuities, Bonds, &c., together with Estates, Houses,

OST VALUABLE COAL MINES, AT NAILSTONE MOST VALUABLE COAL MINES, AT NALUSTONE,
mear BAGWORTH, in the country of LEICESTER.—TO BE LET, for a term of
years to be agreed upon, all those very valuable BEDS or SEAMS of COAL, situate at
Nalithons addressid, extending under 370 ACRES of LAND, or thereshouls, in a ring
fence, and adjoining the prosperous collieries of Lord Maynard on the east, and on the
west are the extensive collieries belonging to the Loicestershire Coal Company at Instock.
The Leicester and Swanington Railway now passes within half a unite of this property,
and by it markets have been opened for the sale of the coal, the produce of these mines,
in the metropolis, Leicester, Northampton, and in very many of the most important
towns of the kingdom. These mines have been proved by the operations of the two
inportant collieries before mentioned, and it has been most satisfactority ascertained that
they are free from faults, and are regular and uniform in their position throughout this
scate. The quality also of these mines is proved to be excellent, and the demand for
coal very great and cortain.
All further information may be obtained by applying to Mr. Henry Holt, mineral agont.

All further information may be obtained by applying to Mr. Henry Holt, mineral agent Wakefield; Messrs. Sudlows, Torr, and Janeway, 38, Bedford-row, London; or to Mr. T. M. Loe, solicitor, Leeds.

STEAM-ENGINE FOR SALE.—TO BE SOLD, BY PRIVATE CONTRACT, a 32-inch cylinder STAMPING ENGINE, single action. PRIVATE CONTRACT, a 33-inch cylinder STAMPING ENGINE, single stroke in cylinder, with steam case, boiler, about 11 tons, and axies and fra ads.—Applications to be made to Hocking and Loam, engineers, Redrath. ted June 26, 1890.

TEAM-ENGINE INDICATORS, OIL TESTS,
COUNTERS, SALINOMETERS, &c. &c.—Mr. W. KELD WHYTEHEAD, CONSULTING ENGINEER, begs to inform the Profession that he has a STOCK of these
SUSTRYMENTS always ON SALE.—Plans and Mechanical Drawings of every description Copied, Reduced, and Lithographed.—Working Drawings of Land and Marine Engines and Machinery designed on the most approved principles—Engines Indicated, and
their Working Order Improved, wherever practicable.

OFFICE—No. 69, CORNBILL, LONDON.

SSAYING AND ANALYSIS.—ASSAYS and ANALYSES
of MINERALS, METALS, SOILS, FURNACE, and all other MANUFACTURPRODUCTS. INVENTORS and INTENDING PATENTEES assisted in PERITING any INVENTION involving an intimate knowledge of chemistry. INSTRUCTION in all branches of ASSAYING, ANALYSIS, and METALLURGICAL and MANUFACTURING CHEMISTRY.

ns to be addressed to Mr. Mitchell, 23, Hawley-road, Kentish Town

CHEMICAL, MINERALOGICAL, AND AGRICULTURAL SCHOOL,—38, KENNINGTON-LANE, LONDON.

The SCIENTIFIC DEPARTMENT under the direction of J. C. NESBIT, F.C.S., F.G.S., one of the Principals.

INSTRUCTIONS are given in AGRICULTURAL CHEMISTRY, and the making of ARTIFICIAL MANURES.—Mineral Analysis taught in all its branches. Analyses performed as usual, on moderate terms.

## THE "KOH-I-NOOR" DIAMOND.

As this celebrated gem has lately come into our possession, the following account, from the manuscript of a gentleman long resident in India. as given in Dr. Murray's work on the diamond, will be found interesting to those who are unacquainted with its early history :-

as given in Dr. Murray's work on the diamond, will be found interesting to those who are unacquainted with its early history:—

"The Koh-i-noor, or mountain of light, is believed by the Hindoos to have descended from their mythological heroes. It is 1½ inch long, I inch broad, and rises half an inch above its gold setting. It weighs 290 carata, and is said to have weighed when rough, 793 carata. This diamond is set in an amulet with a diamand on each side, about the size of sparrows' eggs. Runjeet Singh has also a ruby of considerable size, with the names of several kings engraved on it, and among others those of Aurungzebe and Achmed Schah. He has also a topax as large as a billiard ball, for which he paid 20,000 rupees. The musaud of Aurungzebe was of solid gold, and with the peacock ornament richly studded with jewels, which crowned it, was estimated at 20 millions of gold. Over the palace at Delhi was this inscription—If there be heaven on earth, it is here—it is here. The Prince Aulungeer, in 1658, deposed his father, Schah Jehan, emperor of Delhi, and usurped his throne. He caused to be constructed the famous 'Tukht-i-taoos,' or Peacock throne, which represented in appropriate jewels a peacock with its head overlooking, and its raised and spread tail overshadowing, the person of the emperor when sitting on the throne. The natural hues of the bird were exquisitely imitated by the richest gems of the world, and the eyes were supplied by two celebrated diamonds, the largest known, called (as every Asiatic double name must have a gingle), 'Koh-i-noor,' the mountain of light, and 'Koh-i-Toor,' the mountain of Sinai. Having completed this throne, relinquishing the name of Aulungeer, or 'Grasper of the Globe,' he assumed that of Aurungzebe, or 'Ornament of the Throne.' He died in I707, aged 87, and his throne remained in possession of his auccessors till 1728, when Nadir Schah invaded Indoston, took and plundered Dolhi, and massacred 125,000 men, women, and children: together with 60 millions of other plunder, h

Its subsequent history and recent capture by the Anglo-Indian army is too well-known to need recapitulation.

\* The Koh-i-Toor, "the mountain of Sinai" was plundered by Nadir Schah, afterward taken from the Persians by the Russians, and is now one of the imperial crown jewels it weighs 193 carata, and is valued at 369,800%.

INING AND GENERAL AGENCY OFFICE, PEDNANDREA TIN AND COPPER MINE, REDRUTH- PATENT IMPROVEMENTS IN CHRONOMETERS, No. 52, THREADNEEDLE-STREET, LONDON. WATCHES AND CLOCKS.

The first call to be £10, in two instanments, at one and nour months respectively. It is enough to state that this highly promising and extensive SETT is situate in and around the town of Redruth, close to the following prosperous and dividend-paying mines—viz.: Carn Bres, South Basset, North Basset, and Wheal Buller, and in the immediate vicinity of others of known value and productiveness. The whole of the setts have been secured for twenty-one years, unexpired, from the respective lords and the bounders, at a reduced scale of dues, and a large majority of the shares have been shared a non-producted.

The following report (annexed) is from the only surveying agent at the last working:—
PEDNANDREAMING.

Dear Siz,—In answer to your letter to me requesting a report upon the above mine, I beg to inform you, that I am the only surviving captain who managed this mine at it last working, and that I consider the speculation a fair one, if worked according to my views—viz., that an 90-linch cylinder engine, should be at once placed in the pressni engine-house, and fork the water to the 80 fm. level, under the adit being about 30 fms. from the surface), the levels should be then driven east. There is now in the 35 fm. level end, which is about 80 fms. form the surface), the levels should be then driven east. There is now in the 35 fm. level end, which is about 80 fms. asst of the engine-shaft, at in lode, about 2 feet wide, worth from £10 to £12 per fm., and was so left when the mine ceased to work. About the 60 fm. level there is a splendid lode of tin, which was let at half tribute, whilst he materials on the sation were drawing, and from which four men, who went down and never returned during three days, realized a profit on their proportion of the tin they brought to the surface, of £18 per man; and if this lode continues, there can be no doubt that this alone will give a handsome profit to the adventurers. This is my report, and it shall be at all times ready to furnish you with any information you may require.

To B. Hearle, Esq.

The remaining shares will be at once appropriated to the state of the st

The remaining shares will be at once appropriated to the earliest respectable applicants and as the first general meeting of shareholders is advertised for Thursday, the 3 ist inst. Andrew's Hotel, Redruth, at six F.M. immediately after the ticketing for copper ore, an early application is necessary to be made to the Provisional committee, at Bank-house, Redruth; or T. R. Hearie, Eaq., purser of the mine, Green-lane, Redruth. Applications or particulars can be made in London to Mr. Evan Hopkins, C.E., 13, Austinfriars.

Dated Oct. 9, 1850.

BLACK CRAIG AND CRAIGTON CONSOLIDATED MINES—SOUTH-WEST OF SCOTLAND.

CHARLES BRAGG Eq., Newcastle-upon-Type.
PETER CURGENVEN, Esq., Hertford-road, Kungaland.
CHARLES GILPIN, Esq., Bishopsgate-street Without.
WILLIAM MUSCHAMP, Esq., Derwent Lodge, Sunderl
JAMES VINT, Esq., 7, Bedford-place, Reasington.
Scheffax-Mr., John Watson.
OFFICES—13, GEORGE, VARD, 1607. CONDUCTED ON THE COST-BOOK SYSTEM.

OFFICES-13, GEORGE-YARD, LOMBARD-STREET.

These extensive Lead Mines are situated about two miles from Newton Stewari, near he head of Wigton Bay, in the county of Kirkcudbright, and lie at the foot of a range of nountains nearly at the junction of the clay slate and granite rocks.

Black Craig and Craigton Mines are held under lease for 31 years, from the respective reprietors, and at one-fourteenth dues. These setts extend about three miles on the ourse of the lodes, and two miles from north to south. The principal lode crosses a large ill, and runs in the direction of south of east; it underlays to the south, and is from 18 o 28 feet wide.

ourse of the lodes, and two miles from north to south. The principal lode crosses a large till, and runs in the direction of south of east; it underlays to the south, and is from 18 of See twice. This extraordinary lode was discovered about a century ago, while forming the present nilitary road over the hill referred to, where the ore was found in a solid bunch of conderable thickness. Several other courses of ore were afterwards proved on the course of the lode, some of them extending to nearly 100 fms. In length, and varying from 3 to feet in thickness. In prosecuting these discoveries, immense quantities of ore were asked, and at a very small cost. The poorer portions of the lode were then left as values, but which can now be worked at a considerable profit by means of the present powerful aschinery for crushing and dressing the ore, and other appliances which were unknown the time referred to.

Very large profits were then realised from these mines, for many years amounting to bow £25,000 per annum, and it is fair to presume, that when the complete and powerful aschinery recently erected is in full operation, and the workings extended on the course for now standing between the deep add and the 23 fm. level, that similar large profits for more standing between the deep add and the 23 fm. level, that similar large profits of the new process.

will be realised.

Ore has been recently discovered in the setts, extending considerably east and west of hat portion of the lode already developed, and there can be little doubt will prove equally roductive. Several applications have been made by miners to take bargains on the whole round referred to, and to work on tribute from the surface.

The present available plant consists of about 600 fathoms of adit levels, through which horse iron railway of at least 500 fathoms has been laid, and extending to the drossing corrs. There is also about 200 fathoms of engine and other shafts; several large reservirs, houses, office, smiths 'and joiners' shops, powder and ore house, dressing floors, tock of mining materials, railway waggons, tooks, implements, &c. The machinery consists of a water-wheel, 35 feet diameter, and 2 feet 9 inches breast, used for driving the training mill and dressing machinery. There is also a 40-house steam-engine, with umping and winding gear; the whole of which has been recently estimated at the vaator £16,000.

ushing mill and dressing macrons, ampling and winding gear; the whole of which has been recently enumerated and in the of £16,000. During the twelve months ending May 1st, 1850, 296 tons of lead ore were raised and id at the net produce of £3769. The cost of raising the same, including dressing, dues, mber, &c., was £2496—having a profit of £1266 upon the twelve months' workings, here the month of May, chief attention has been devoted to the clearing of the engine last in the western ground, and it is expected the water will be drained from the bottom viel in a few days, from which it is calculated that considerable quantities of ore will be according to the state of the interest at £2 and the considerable quantities of the interest at £2 and the considerable quantities of the interest at £2 and the considerable quantities of the considerable quantities of

ved in a few days, from which it is calculated that considerable quantities of ore will be peedily raised.

These mines were the property of gentlemen who sold a portion of their interest at £5 er share, having, previous to so doing, undertaken to pay all the cost of working the ines up to the 30th of June last, together with all expenses connected with the contents of the steam-engine, and the pumping and winding apparatus, being entitled to if ores raised up to that time, and at the expiration of the term specified they delivered by the mines to the shareholders, generally free of all debts and Habilities whatsoever, to shareholders becoming from that date entitled to all benefits and profits. The original orprietors are disposed to part with a further small portion of their remaining interest the public, at the rate of 5t. per share; and as beyond all doubt the company will cortly be in receipt of rapidly increasing funds from the sales of the ore, and as at the essent moment there is a considerable balance in the hands of the company, the adventer is confidently offered to the public as one of great promise and advantage. All parties siring an interest in this undertaking are at liberty to send their own agents to inspect emines. The cost-book, with the rules of the company, can at any time befinspected, and every information obtained, and a plan of the mines, with specimems of the ore, can be en on application to the secretary, 13, George-yard, Lombard-street.

IMPORTANT DISCOVERY OF SILVER LEAD MINES, near BRISTOL.—The attention of persons interested in MINING PROPERTY is particularly directed to these valuable SILVER-LEAD MINES, recently discovered, and proved at considerable expense. It is proposed to FORM a COMPANY to WORK these HINES, to be called the ITCHINGTON HILL SILVER-LEAD MINENG COMPANY, to be conducted on the Cost-book Principle, which, by Act of Parliament, exempts share-holders from any liability beyond the amount subscribed on their shares. The sett, or grant, comprises about 80 seres, and is held direct from the Lord of the Manor, at 1-20th dues, or 5 per cent. on the produce, for a period of 21 years, from June, 1880. The situation is highly advantageous, being only 16 miles from Bristol, four from the Wickwar Station, on the Birmingham and Bristol Railway, and within 6 of the River Severn. Several very valuable lodes have been discovered, three of which have been explored to some extent, showing throughout indications of a highly motalliferous quality, which the reports will fully explain, and samples seen at the Company's offices.

From the peculiar situation of the lodes, and she natural character of the district, it is considered that expensive machinery will be unnecessary.

A considerable sum of money has been expended on the only required speculative outly, the lead being actually discovered. Gossan, fluor-spar, sulphuret of barytes, and other indications of there being a largely productive mine, have been found, fully justifying the shareholders in anticipating a return on the capital invested, equal to the most valuable mine now working.

The mine is to be divided into 2072 shares: 2272 of these will be issued to the capital. MPORTANT DISCOVERY OF SILVER LEAD MINES

fying the shareholders in anticipating a return on the capital invested, equal to the most valuable mine now working.

The mine is to be divided into 3072 shares; 2272 of these will be issued to the public, on which £3 per share is to be paid on signing the Cost-book; this sum the proprietors are fully assured will carry on the works effectually.

Various aways have been made, and the ore is found to be exceedingly rich in silver; one by Mr. Clements, of the Panther Lead-Works, Bristol, produced 55 per cent. of lead, and 7 ices. I dwt. of silver to the ton of ore, and valued by him at £19 10s, per ton, as produced at the mouth of the mine; another by Mr. Johnson, of 79, Hatton-garden, Lone don, produced 12 ewts. of lead and 65 oxs. of silver to the ton. The price of lead ornsually averages about £11 per ton.

Applications for shares to be made to Mr. S. J. Green, at tile offices of the Company, No. 9, Hart-street, Bloomsbury-square, London, where specimens of the ore may be seen; and to Mr. War. Alveston, near Bristol, with whom the cost-book will lie for signature, and to Mr. War. Alveston, near Bristol, with whom the cost-book will lie for signature,

to Mr. Wray, Alv e of country sharel

STIRLING'S PATENT YELLOW METALS—Adapted for SHEATHING, BOLT STAYES, BOLT NAILS, DEOK NAILS, as reported by the late Mr. Owen, Supervisor of Metals to the Admiralty; also for PROPELLERS, FRAMEWORK SCREWS, PISTONS, CYLINDERS, COCKS (particularly where there is exposure to corrosion), RAILWAY CARRIAGE AXLE BEARINGS, and for all machinery subject to frietion.
